

What is remaining

Colour tells you whose it is. **Green is finished. Purple is mine. Amber needs you. Grey is later.**

■ Done
 ■ Mine — no input needed
 ■ Yours
 ■ Later, if you still want it

DONE

The data is real now

85 organizations across your seven renamed rungs. The old demo is off.

DONE

The map is a tree, and it responds

Tap a branch to open it. The camera pans instead of teleporting.

YOURS — NOW

Put a number of days on each stage

All seven are still empty, so “at risk” is stuck on zero.

5 min

MINE — NEXT

Fix what overlaps, and the counts that read 0

The bars cover the picture. Node counts count the wrong thing.

in progress

MINE

The PMO Dashboard — its own page

Overview, projects and follow-ups, risks. Built for Nawaf.

next

BOTH

Jira — choose which spaces to read

I build the picker. You connect it once and press Test.

mine + yours

YOURS

Give your team their codes

16 of 18 people have still never signed in.

10 min

MINE

Tidy the Settings screens

17 cards become about 11, grouped and plainly named.

after

LATER

The SGH plan — 176 activities

Only if you still want it. See page 6 for why I would wait.

last

What changed today

So you can see what the colours above are built on.

85	50	12	0
organizations, live was 1	with a stage was 0	goals with dates was 0	of 7 rungs have a day count

Three things were wrong and each had to be fixed before the data would load. They are worth knowing because two of them were caused by work **you** did, and that work was right.

1 · Almost everything was hidden

22 of your 23 organizations were archived — the whole old demo. That one fact explained the three-box map, the “1 organization” portfolio, and every zero on the screen. Nothing was broken or missing. It was just switched off.

2 · The demo named people who did not exist yet

It was written before you created the 18 accounts, so it referred to “Aziz” and “Nasser Alabri” — names the workspace has never heard. Every row was refused. I pointed them at the real roster and spread the organizations across **five** account managers instead of two, so the Team view has something to show.

3 · You had renamed the stages — and the demo had not caught up

Your ladder now reads **Integrating & Testing, UAT, Go-live readiness**. The demo still used the words it shipped with, so another 30 rows were refused. I matched them to your words.

Note what happened here: **the importer refused everything rather than guess**. It would not invent a person and it would not invent a stage. That is the behaviour you want the day you load your real four hundred.

Yours, now — five minutes

The one thing holding back a quarter of the app.

Beside each stage there is a box for **expected days**. Put a number in the middle four. Leave the other three empty.

YOUR STAGE	DAYS
Not started	leave empty
Kickoff	a number
Integrating & Testing	a number
UAT	a number
Go-live readiness	a number
Live	leave empty
Paused	leave empty

Empty today

At risk: always 0. Stalled list: always empty. Median days: a dash. Sorting by “stuck longest”: nothing to sort.

With a number

All four come alive across 85 organizations — and the PMO dashboard has real figures to open on.

Guess

A rough number beats no number. Later the tool will measure how long each stage really takes and you can replace your guess with the true figure.

First — the things you can see are wrong

The bars cover the picture. The row of view names floats on top of the tree and on top of the portfolio's own controls, cutting a sentence off mid-word. A node's pop-up covers the node it describes.

Every count on the map reads 0. They count *work items*, not organizations — so a branch holding 18 hospitals says “0”. On an onboarding tracker that is the wrong number on the wrong box, and it is why the map still looks lifeless with 85 organizations in it.

Names cut off — “Associate ...”. The boxes are narrower than the names you actually use.

Then — the PMO Dashboard

Its own page in the menu, built for **Nawaf**: an overview, the projects and their follow-up tasks, and the risks. It reads the data you already have, so it works whether or not Jira is connected. Revenue and the document store are deliberately left out — page 6.

Then — Jira by space

A picker so you tick which Jira Service Management spaces to read, instead of writing a query by hand. The hand-written query stays, folded away under “Advanced”.

Then — the Settings tidy-up

Seventeen cards in one long scroll become about eleven, grouped, and renamed in plain words. “Vocabulary”, “Catalogue” and “Terminology” are indistinguishable unless you built them.

Jira — press Test connection

Your three secrets are set and the program now knows about Atlassian's second door, so your read-only token should work. **Settings** → **Jira** → **Test connection**.

Worth being straight with you: **Jira has never once connected**. Until that button goes green, everything I build on the Jira side is guesswork. It is the one thing in this whole list that code cannot do for you.

The sixteen invite codes

16 of your 18 people have still never signed in. Only you and Nasser have. A tool nobody has opened cannot be judged, adopted or trusted — and the PMO dashboard is being built for a man who does not yet have a way in.

If you have lost the codes, say so and I will make fresh ones. Easy now; awkward once people are using them.

Optional — the 0030 file

One more SQL file, same routine as the four you did, **5 grey lines**. It makes room for a screen where you change how the map looks. **Skipping it breaks nothing** — the app uses my defaults until it is run. I would leave it until the map settles.

Four things from the PMO document, refused

A council of three reviewed the whole request before I started. These four came back as no, and I would rather tell you why than quietly drop them.

Open-by-link access

The original dashboard is readable *and editable* by anyone with the link. In this app, a request with no signed-in user is treated as **the most trusted writer there is** — that is how the internal jobs are recognised. Opening a public door would quietly hand every stranger the highest level of trust in the system. This one is not a preference.

Revenue, and the document store

There is no money anywhere in this system and nothing to check a figure against; a revenue tab would be numbers nobody can verify. And the app stores **no files at all** — your privacy policy says so. The seven documents work as a **checklist** with a link each: same progress bar, no filing cabinet.

PowerPoint and PDF export

Both need new libraries this app has deliberately never taken on — it draws its own charts for that reason. Your browser already prints to PDF, and the Digest already produces a report you can paste straight into Word or Outlook with its formatting intact.

The 176 SGH activities — not refused, but not yet

Making them editable here would build a **second task tracker** inside an app whose whole story is that onboarding lives in Jira. Within a month there would be two versions of the truth and you would trust neither. If the plan matters, it belongs where the work is, and this tool should read it. **Say the word if you disagree** — it is your call, not mine.

The short version

Put day numbers on four stages. That is the only thing standing between you and a quarter of the app. Everything else is mine or can wait.
