

What to do now

Five things. About **half an hour** in total. They are in the order I would do them — the first one takes two minutes and is the interesting one.

1

Look at the new map

Tell me what is wrong with it

2 min

2

Put a number of days on each stage

Switches on the “stuck” warnings

5 min

3

Run one more SQL file

Same as last time. It is called 0030

10 min

4

Press Test connection for Jira

I fixed the problem you hit

2 min

5

Give your team their codes

16 people still cannot sign in

10 min

Arabic names for the stages

You did this — all seven have Arabic now

done

Nothing here can break anything

Every one of these is either looking at something, typing a number, or pasting a file that checks its own work. The site keeps running throughout.

1

Look at the new map

Two minutes. This is the thing you said looked terrible.

Open this address. The **?tree=1** on the end is what shows the new drawing.

nphiescore.com/#/mindtree?tree=1

You should see a proper family tree. Your programme at the top, then the two directorates, then each manager, then their organizations — every one a box with its name, its number, and a red dot if it is in trouble.

Now take the **?tree=1** off the end and load it again. That is the old drawing, so you can compare them side by side.

Two things are still wrong, and I already know about them

Sliding and zooming feels a bit odd. The part of the app that moves the picture around still thinks in circles. I am rewriting it.

The whole tree leaves empty space above and below. It is very wide and not very tall, so fitting it sideways wastes the top and bottom. Being able to fold branches shut is what fixes that, and it comes with the same piece of work.

What I need from you

One message. What looks wrong, in your own words. “I don't know why but I don't like it” is genuinely useful — I can usually find the reason. Do not be polite about it.

2

How many days is too long?

Five minutes. The most useful five minutes on this list.

Find your seven stages. Beside each one is a box for **expected days**. All seven are empty right now.

It means: if a hospital sits on this stage longer than this many days, something is wrong and the app should say so.

While they are all empty

The **at-risk number** stays on zero forever — which reads as “nothing is stuck”. The **Stalled list** is empty for everyone. And nothing can be sorted by “stuck the longest”.

Fill in a number for the **middle four** only:

STAGE	DAYS
Not started	leave empty
Kickoff	put a number
Integrating	put a number
Testing/UAT	put a number
Go-live ready	put a number
Live	leave empty
Paused	leave empty

Guess. Really.

A rough number today beats no number. Later the app will measure how long each stage *actually* takes, and you can replace your guess with the real figure.

3

Run one more SQL file

Ten minutes. Exactly like the four you already did.

It is called **0030**. It makes room for the map settings screen — so you can change how the tree looks without me.

1

In Terminal, these two lines:

```
cd /Users/aziz/Claude/nphiescore
pbcopy < supabase/migrations/0030_map_view_settings.sql
```

Nothing appears to happen. That is right — the file is now copied.

2

Go to the Supabase **SQL Editor**, same as last time. Click in the big box, press **⌘A** then **Delete**, then **⌘V**.

3

Press **⌘↵**. Wait a few seconds.

4

Count the grey lines.

5 grey lines. No red line.

5

Do it a second time. ⌘A, Delete, ⌘V, ⌘↵.

5 grey lines again, saying the same things. Then you are done.

Why twice, again

Same reason as before: it proves the file can be run again safely, so if anything ever needs repairing the answer is simply “run it again”.

If you skip this one, nothing breaks

The app works fine without it — it just uses my settings instead of yours. You can do this whenever.

Try Jira again

Two minutes. I fixed the thing that was blocking you.

nphiescore.com

Settings

>

Jira

>

Test connection

Change nothing first. Your token is fine. Your three secrets are fine. Just press the button.

What was wrong

Your read-only token is only accepted at a different Jira address from the ordinary one. The program was knocking on the wrong door, so Jira said no to a perfectly good token. **It now knows about both doors** and tries them in turn.

If it works

It turns green and names the account and the Jira site it signed in as. That is the whole test. Tell me and I will help you with the next part — matching your Jira projects to your organizations.

If it still says no

Send me the exact words. The message names which of the three secrets it thinks is wrong, and it never shows the value, so it is safe to copy to me as it is.

5

Give your team their codes

Ten minutes. Sixteen people cannot sign in yet.

Right now: 18 accounts exist. Only **you and Nasser** have ever signed in. The other 16 are waiting.

- 1 Find the sixteen codes you copied out of Terminal when you made the accounts.
- 2 Send each person **their own** code. Directly — not in a group chat, and not to me.
- 3 Tell them what to do with it:

Go to **nphiescore.com** → click **First time here?** → type the code → choose a password.

If you have lost the codes

They exist nowhere else — not in a file, not in the database, not with me. That is on purpose. **Just tell me** and I will make new accounts for whoever needs one, which prints fresh codes. Easy now; awkward once people are using them.

What I do next

Make the tree the normal view

Rewrite the part that slides and zooms the picture so it understands boxes instead of circles. Then the **?tree=1** goes away and the tree is simply what you see. Branches will fold shut, which is what stops 400 organizations becoming a wall.

Put real demo data in

You still have 22 made-up organizations from an old trial, and none of them has a stage. I will swap them for 72 spread across all seven of your stages, so the screens have something true to show. Say when.

Give the app a memory

Today it knows where each hospital **is**, but not where it has **been**. So it cannot answer “are we going faster than last month” or “will we make December”. That is the biggest missing piece and it is next after the map.

Then the things a director expects

Search for a hospital by name. A red/amber/green you set yourself, with a reason, beside the one the app works out. And a forecast line showing whether you will hit your dates.

The short version

Look at the map and tell me what is wrong. Everything else on your list can happen whenever you have a spare ten minutes.
