

What is next

The tracker is built, live, and holding your real programme. What it is missing is **people in it** and **your portfolio typed into it**.

104

organizations,
all on a rung

406

capability links
read from Jira

2

people have
ever signed in

0

rows in the
new portfolio

Everything on the left is finished and needs nothing from you. Everything on the right is waiting on a person, and for most of it that person is you. There are **four things**, and the first two are the same job done twice.

If you only do one thing

Do **Step 1**. Nine of your colleagues have a code sitting ready. Until somebody other than you signs in, the tracker is a very well-built private page.

1

Hand out nine invite codes that are already waiting in a file on your Mac

20 min**2**

Issue sixteen new codes from inside the app, because the originals were shown once and not kept

25 min**3**

Type one project into the portfolio and tell me what is wrong with the form

15 min**4**

Decide the thirty-three organizations that have no owner — a rule from you beats thirty-three guesses

10 min

What these words mean

Nothing later uses a term that is not on this page.

Username

sara.alsaab

How your colleagues sign in. It is **not an email address**. Every person already has one, made from their name, and it can never be changed afterwards.

Invite code

XXXX-XXXX

A one-time password that turns an account from “created” into “usable”. The person types it once, chooses their own password, and the code dies. **It is shown once and can never be shown again** — only replaced.

Claim

The one-page screen where a person does that, at **nphiescore.com/#/claim**. They need their username, their code, and a password they invent on the spot.

The portfolio

The PMO tab’s new half: your projects, initiatives, actions, risks, revenue and OKRs. It went live today with the forms to fill it. It is empty.

Capability

One of the ten things an organization can integrate — eligibility, pre-authorization, claims and so on. Each organization’s ten make the 406 links.

Owner

“account manager”

The person you would chase about one organization. Read from whoever holds most of its Jira tickets.

The one rule

Invite codes are handed over in person, never emailed and never typed into a chat — including mine. They are passwords. The app itself says so on the screen.

Where things actually stand

THE PROGRAMME

Live		82
In testing		138
Planned		186

82 of 406 capabilities are live — one fifth. That is the number the home screen opens on, and it is now read from real Jira data rather than invented.

Finished — nothing owed

All 104 organizations sit on a rung. 71 have an owner. The seven rungs have day targets, so “overdue” means something. Roles are real: 2 admins, 7 directors, 18 members. The map opens as a readable list on a phone.

Waiting on a person

25 of 27 accounts have never been used. The portfolio’s eight tables hold nothing at all. 33 organizations still have no owner. Ten work items and two meetings exist in a workspace built for a programme of 104.

Two things that look wrong and are not

Your colleagues’ email addresses end in @opstrack.internal. That domain does not exist and is not meant to. Usernames are the login; the address is internal plumbing the system needs and nobody ever reads.

The portfolio being empty is not a fault. It is a new shelf, built today, with nothing put on it yet.

about 20 minutes

Step 1 — hand out the nine codes you already have

Nine people have a live invite code waiting in a file on your Mac. Nothing needs to be generated. You are copying nine short codes to nine people.

- 1 Open the file **.invite-codes.local** in the project folder. In Terminal, type these two lines — the second opens it in TextEdit rather than printing it anywhere it could be copied by accident:

```
cd ~/Claude/nphiescore  
open -a TextEdit .invite-codes.local
```

A table opens: name, job title, username, then the code in the last column.

- 2 Find the nine rows that have a code in the last column. They are the **onboarding engineers** — Dema, Riam, Shatha, the two Khalids, Hind, Nawaf, Lama and Omar.

- 3 Give each person **two things**: their username and their code. In person, or on a call — not in an email or a group chat.

Tell them to go to **nphiescore.com**, then **Claim your account**.

- 4 They type the username exactly as written, the code, and **a password they choose themselves**. You never see their password and you do not need to.

When it works they land straight in the tracker, signed in.

The trap

A code works **once**. If somebody mistypes it three times and gives up, the code is not “still there” to try again later — but it is also not lost. You issue a new one, which is Step 2. There is no screen anywhere that will show you an old code again.

about 25 minutes

Step 2 — the other sixteen need a new code

Sixteen accounts were created earlier. Their codes were shown once, at the moment of creation, and were not kept. This is normal and is how it is supposed to work. You issue each of them a fresh one, from inside the app, one at a time.

- 1 Sign in at **nphiescore.com** as yourself, then go to **Settings** → **Members**.

A list of all 27 people, with their username and role.

- 2 Find a person who has not signed in and press **New code**.

A confirmation appears: their current code stops working immediately, and the new one is shown once.

- 3 **Write the code down before you close that message.** This is the only time it is visible. Then give it to that person the same way as Step 1.

- 4 Repeat for each of the sixteen. Do them in whatever order suits — there is no sequence, and stopping halfway breaks nothing.

This is also your password-reset button

A username account has no mailbox, so there is nothing to send a reset link to. When somebody forgets their password, **New code** is the answer — the same three presses. Worth knowing now, because you will be asked.

Optional, and only if you want self-service resets

If you give me the sixteen **real** email addresses later, they can reset their own passwords by email and stop coming to you. It changes nothing else, and it is not needed for anyone to start using the tracker.

15 minutes for the first one

Step 3 — put your first project in the portfolio

The PMO tab has eight new tables behind it — projects, initiatives, actions, risks, revenue, objectives, key results and milestones. Every one is empty. The forms to fill them went live today. You only need to add **one** of anything to see whether the shape fits how you actually work.

- 1 Go to **PMO**, then the **Projects** tab.

“No projects yet”, and a button reading **Add a project**.

- 2 Press it and fill what you know. **Only the name is required**. Manager, budget, dates and lifecycle can all be left blank.

Blank stays blank. It does not become zero, and the screen will say “nobody has said” rather than inventing a number.

- 3 If the project has a Jira ticket, put its key in the **Jira** field — for example **NONP-142**. That is what ties your portfolio back to the board your teams already use.

- 4 Press **Save**, then look at the card it makes.

The row appears immediately, with an edit control and, because you are an admin, a delete.

Then tell me what is wrong with it

This is the real purpose of Step 3. I built these forms from the shape of your migration, not from watching you work. One filled-in project will tell you in a minute what a specification could not: a field that should not be there, one that is missing, a word that is not the word you use. **That feedback is worth more than the row.**

You cannot break anything here

Nothing in the portfolio feeds the map, the home screen or the 82-of-406 number. It is a separate shelf. A test project you delete afterwards costs nothing.

10 minutes

Step 4 — the thirty-three with no owner

Of your 104 organizations, **71 have an owner and 33 do not**. That gap is deliberate. Owners were read from Jira, and only assigned where **one person holds at least 60%** of an organization's tickets. For the other 33, no single person was close enough, so the field was left empty rather than guessed at.

Why blank was the right answer, and why it cannot stay

A wrong owner is worse than none: it sends a chase to somebody who cannot act and quietly tells you the question is handled. But while the field is empty, those 33 organizations cannot appear in anybody's "mine", and nobody is accountable for them.

YOU HAVE THREE WAYS TO CLOSE IT

- A Name them yourself.** Open the map, tap an organization, and set the owner in the panel that opens on the side. Thirty-three taps, and it is done properly.
- B Lower the bar and let me re-run it.** Say the word and I drop the threshold from 60% to a simple majority. It will fill most of the 33 and it will get some of them wrong.
- C Give me a rule.** "Anything in the Eastern cluster is Riam's" is a sentence I can apply to all of them at once, and you will be right more often than the ticket counts are.

My recommendation

C, then A for the leftovers. You know the split by region and team in a way the Jira assignee field does not. Ten minutes of rules will beat thirty-three individual decisions, and whatever the rules miss is a short list you can finish by hand.

What I am doing, so you do not wonder

None of this needs a decision from you. It is here so the list on the previous pages reads as short as it really is.

- 1 **A chart runs 14px off the edge of the PMO page on a very narrow phone** (320px — an iPhone SE). Found while measuring the Arabic OKR tab. It does not affect the 375px phones everyone actually carries, and it is a one-line fix in its own commit.
- 2 **Milestones have no screen.** Seven of the portfolio's eight tables can be filled in; milestones cannot, because a form for rows nobody can see is a write-only screen. It is a section plus a form whenever Step 3 says the rest of the shape is right.
- 3 **Waiting on Step 3.** What you find when you fill in one project decides what I build next in the portfolio. Until then I would be guessing.

Already done since we last spoke

The map opens as a readable list on a phone instead of 104 unreadable specks, with a button back to the picture. The portfolio's seven forms. The Arabic OKR tab now reads **الأهداف والنتائج (OKR)**. All of it is live on nphiescore.com.

One thing about phones

The app asks before it updates itself. Anyone who added it to their home screen keeps the old version until they accept the prompt. If a colleague says a new thing is missing, that is almost always why — close the app fully and reopen it.

Done looks like this

Step 1 — nine codes handed out

How you know: Settings → Members shows those nine as having signed in. Or simpler: they tell you they are in.

Step 2 — sixteen new codes issued and handed out

How you know: nobody in Members is still marked as never having signed in. The home screen's "needs attention" count starts meaning something, because there is finally more than one person to attend to it.

Step 3 — one project typed in, and a verdict

How you know: the Projects tab shows a card instead of "No projects yet", and you have told me what was wrong with the form.

Step 4 — a decision on the thirty-three

How you know: either the map shows an owner on every organization, or you have given me the rule and I have run it.

And then the real test

Ahmed Alnaji opens nphiescore.com on his phone and, without asking anyone how it works, can answer "**how much of the capability set is live?**" in one glance. Everything in this document exists to make that sentence true.
