

How this programme records what it is doing

Thirty-seven requirements for tracking the onboarding of Saudi Arabia’s hospitals onto the Unified Health Record. Each one carries its English and its Arabic side by side in this file, and each one names the measurement it came from.

THE CHANGE, IN ONE LINE

The unit of record becomes **one ticket per hospital per use case** — $141 \times 11 = 1,551$ — and the rung it has reached becomes its status, so that what nobody has said stays visibly unsaid.

WHO APPROVES

Abdulaziz Alsaloom, PMO Lead, and nobody else. Nothing here is built before that mark is on page 29. A job title never carries approval.

Read this first — what the document does not do

It commits **no dates**. 89 of the 2,971 tickets in the tracker carry a due date; 3 of the 828 open ones do; **0 of the 552 open onboarding ones** do. Asking people for dates has been tried here. Every number below carries the count it was taken from, and where something has not been measured it says so rather than printing a zero.

Requirements	37, numbered BRD-001 to BRD-037, in 9 areas
Already built and tested	3 — BRD-001, BRD-015, BRD-016
Agreed, waiting on this approval	30
Gated or deferred	4 — BRD-025, and BRD-010, BRD-026, BRD-030
Written	26 August 2026, from decisions taken 25–26 August

Every requirement is one block, in two languages

A second Arabic document would drift away from the English one within a month. So there is no second document: the Arabic sits **beside** the English on the same requirement, written as an original rather than fetched as a translation. Under both sits the measurement the requirement came from, quoted in the language it was measured in.

BRD-000 The shape of a block AGREED

The English statement sits on the left and reads left to right. It says what will be true, not what someone hopes for.

شكل الفقرة

النص العربي يجلس إلى اليمين ويُقرأ من اليمين إلى اليسار. وهو مكتوب أصلاً، لا مترجماً عن الإنجليزية.

Measured — the fact that forced the decision, always with its denominator: **498 of 533 custom fields are empty on all 2,971 rows**, never “most fields are empty”.

THE FOUR RULES EVERY SENTENCE HERE OBEYS

Never a bare percentage	“222 of 715”, never “31%”. The denominator is the honest half.
“Nobody has said” is never zero	An unrecorded fact is not a measurement of nothing.
No KPI from unconfigured inputs	“0 at risk” is true arithmetic and a false sentence.
A ladder is drawn as position	Distance along DEV → PROD, never a set of hues.

WHAT THE FOUR STATE MARKS MEAN

BUILT 3 requirements	In the product now, with a test that reddens if it is undone.
AGREED 30 requirements	Decided with the owner, not yet built. This approval releases them.
GATED 1 requirement	Blocked behind a proof that has not happened — the Jira read.
DEFERRED 3 requirements	Deliberately not now, and the reason is written down.

What is being tracked, and how much of it has ever been written down

Thirteen identity rulings taken on 25 August collapse 161 tracker organizations to **141**. Eleven use cases run against each of them. That grid — and only that grid — is what this programme delivers.

Organizations, after the rulings	141 — 20 rows merged away from 161; two Aseer rows stay flagged pending allocation rather than becoming a 142nd
Use cases	11 — ADT; Medication Prescribe V1 and V2; Medication Dispense V1 and V2; Rad Report; Rad Order; Lab Result; Lab Order; Clinical Notes; Vital Signs
The grid	141 × 11 = 1,551 records. This is the whole universe.
... with a live record today	497 of 1,551
... whose only ticket is closed	179 of 1,551, at a median resolution date of 21 April 2026
... never written down at all	875 of 1,551
The rungs, per use case	DEV → STG/TEST → COC → PROD. COC is the Certificate of Completion , signed by CHI , the client.
Budget per rung	10 days , uniform and configurable as four numbers
Organizations with no OB Account Manager	42 of the 161 tracker rows, holding 203 of the never-written pairs — the largest single block of the backlog

Where “roughly 1,100” comes from, since two numbers are in circulation

On day one, **1,054 of 1,551** records will sit in **Intake** — the 875 nobody has ever written down, plus the 179 whose only evidence is a closed ticket carrying no readable rung. That is the “roughly 1,100” quoted in BRD-003 and BRD-034. The two figures are the same measurement counted at two boundaries, and both are printed here rather than one being quietly picked.

The single sentence this whole design exists to make possible

“Of the N records at STG/TEST, M are flagged, and here is who each one is waiting on.” **Today’s data cannot produce that sentence at all.**

What the tracker holds today, counted rather than described

Every figure below was read from the 2,971-row export, not from a document. They are the reason each requirement takes the shape it takes.

Tickets in the instance	2,971 , of which 828 are open
... that are not the onboarding record	2,049 of 2,971 — support, SSO, whitelisting, errors, configuration. 276 still open.
... readable as a hospital × use-case pair	922 of 2,971, across thirteen title conventions, giving 744 distinct pairs
Pairs already carrying more than one ticket	149 of 744 — 327 tickets, 178 to be absorbed
Open onboarding tickets naming no rung	531 of 552
Open onboarding tickets naming no hospital	531 of 552 — 420 say “Lean Business”, 111 are empty
Open onboarding tickets with a due date	0 of 552
Open onboarding tickets with a checklist	2 of 552
Held by four people	435 of the 552 open onboarding tickets, and 526 of the 828 open items instance-wide
Closed onboarding tickets saying <i>why</i>	0 of 370 — all 2,165 resolved tickets in the instance carry the single Resolution Done
Custom fields	533 , of which 498 are empty on all 2,971 rows — including Account Manager , COC Status , Checklist Progress %
Tickets flagged as blocked	2 of 2,971; Action Pending With is set on 0 of 2,971
Age of the median open item	216 days . 261 are older than a year; the oldest is 875 days .
Attachments	5,339 — ~2,455 images, 1,688 documents, 969 structured-text files
Arabic in any ticket summary	0 of 2,971, in a programme whose first language is Arabic

And inside the product itself

All **161** stage records were written by a script with no author, at exactly two timestamps.

setNodeUseCase — the one function that writes the atom of progress — has **zero production call sites**: the thing being tracked cannot be recorded from anywhere in the user interface. The Jira read connection returns **200 with zero rows** for every content query.

BRD-001 Patient-data quarantine **BUILT**

Ticket descriptions, comments, attachments, environment and worklog are never fetched, quoted or re-derived: `jira-read` refuses those field names outright and refuses the `*all` / `*navigable` wildcards that would fetch them without naming them, and every measurement in the programme is taken from the safe projection. Cleaning the source field is separate, later work with its own owner. If a question can only be answered by reading Description, the answer is that the question is not answered yet.

Measured — the scan of the 2,971-ticket export found raw HL7 v2 clinical payloads pasted into Descriptions: **522** IPv4 addresses, **37** ten-digit national-ID/Iqama-shaped numbers, **22** MRN or patient-id mentions, **9** certificate or private-key blocks, **57** email addresses. The safe projection keeps **628 of 702** columns over the same 2,971 rows and was verified before use — HL7 segment markers 8 → 0, key blocks 24 → 0, emails 197 → 1.

حَجَرُ بيانات المريض

وصف التذكرة وتعليقاتها ومرفقاتها وحقل environment وسجل العمل لا تُجلب ولا تُقتبس ولا يُعاد اشتقاقها أبدًا: دالة `jira-read` ترفض أسماء هذه الحقول صراحةً، وترفض معها `*all` و `*navigable` اللذين يجزئها دون تسميتها، وكل قياس في البرنامج يُؤخذ من الإسقاط الآمن. أما تنظيف الحقل نفسه في المصدر فعمل منفصل لاحق وله مسؤوله. وإذا كان السؤال لا يُجاب إلا بقراءة Description، فالجواب أن السؤال لم يُجب بعد.

BRD-023 The CHI contact is a name and nothing else **AGREED**

`coc_contact` holds a person's name. No email, no phone, no title. A contact outside the organization is a higher bar than a colleague, not a lower one; contact details stay in whatever system the PMO already keeps them in.

جهة اتصال CHI اسم ولا شيء غيره

`coc_contact` يحمل اسم شخص. لا بريد، ولا هاتف، ولا مسمى وظيفي. جهة اتصال خارج المنظمة سقفها أعلى من سقف الزميل الأدنى، وتفاصيل التواصل تبقى في النظام الذي يحفظها فيه الـ PMO أصلاً.

Measured — this workspace holds no staff emails by design and forbids attachments outright, and its privacy page is written from what the schema actually contains. The safe projection had to reduce **197 email addresses to 1** before anything could be measured at all.

BRD-034 The weekly report carries its denominators **AGREED**

The compliance report runs fourteen rules, resolves each to a person (the Assignee, then the organization's Account Manager, then the PMO Lead — and a rule that resolves to nobody is a finding in its own right), prints every sentence against its denominator and never as a bare percentage, and goes out in Arabic and English at Sunday 07:00 Asia/Riyadh.

التقرير الأسبوعي يحمل مقاماته

تقرير الالتزام يشغل أربع عشرة قاعدة، ويحيل كل قاعدة إلى شخص (المُسند إليه، ثم Account Manager الخاص بالمنظمة، ثم قائد الـ PMO — والقاعدة التي لا تُسند إلى أحد ملاحظة بذاتها)، ويطبع كل جملة على مقامها لا نسبة مجردة، ويخرج بالعربية والإنجليزية الأحد الساعة 07:00 بتوقيت الرياض.

Measured — its first run reads **497 of 1,551** pairs with a live record, **179** with only a closed one and **875** never written; **531 of 552** open onboarding tickets name no rung, **552 of 552** carry no due date, **550 of 552** have no checklist and **435 of 552** are held by four people.

Overleaf: what it looks like.

The weekly report

serves BRD-034 · and reads the counts BRD-002, 003, 005, 012, 014, 017, 021, 031 produce

TODAY

اليوم

AS IT WILL READ

كما سيُقرأ

There is no weekly report. Nothing goes out on any day, in any language.

The fourteen questions it would ask can each be asked by hand today, and thirteen of them return an answer nobody wants to read: 531 of 552 records name no rung, 552 of 552 carry no target date, 370 of 370 closed records say nothing about why.

The fourteenth — the 10-day budget — cannot be asked at all, because no rung clock has ever started.

Why this is the first page of the pair. The report is the surface that forces every other requirement to be honest: a rule that resolves to nobody is printed as **R5** rather than dropped, and a rule that cannot be computed is printed as *not measurable yet* rather than as zero.

Weekly compliance — 14 rules		تقرير الالتزام الأسبوعي — 14 قاعدة
Sunday 07:00 Asia/Riyadh		الأحد 07:00 بتوقيت الرياض
141 organizations × 11 use cases = 1,551 records. 497 live · 179 closed-only · 875 never written down. Every line below carries its denominator. None of them is a percentage.		كل سطر يحمل مقامه، ولا سطر منها نسبة مئوية.
R1	A pair carrying more than one open record resolves to: Assignee	26 of 744 pairs زوج يحمل أكثر من سجل مقترح — 26 من 744
R2	An open record naming no rung resolves to: Assignee	531 of 552 records سجل مفتوح لا يذكر درجته — 531 من 552
R3	Two records with the same title, exactly resolves to: Account Manager	37 titles over 77 tickets عنوانان متطابقان حرفياً — 37 عنواناً في 77 تذكرة
R4	On the ladder with no target date resolves to: the automation account	552 of 552 open records على السلم بلا تاريخ مستهدف — 552 من 552
R5	A rule that resolves to nobody resolves to: PMO Lead	42 of 141 organizations unowned قاعدة لا تُسند إلى أحد — 42 منظمة من 141 بلا مالك
R6	Past the 10-day rung budget resolves to: —	not measurable yet — no rung clock has fired تجاوز مهلة العشرة أيام — غير قابل للقياس بعد
R7	Quiet for 14 days resolves to: Assignee	312 of 497 records that have a clock سجل صامت 14 يوماً — 312 من 497 لها ساعة
R8	Closed with no reason given resolves to: Account Manager	370 of 370 closed onboarding tickets إغلاق بلا سبب مذكور — 370 من 370
R9	More than 10 days with CHI resolves to: PMO Lead, who asks CHI	11 of 26 records at COC أكثر من 10 أيام لدى مركز الضمان المسمي — 11 من 26
R10	Flagged as blocked, waiting party unnamed	2 of 2 flagged tickets

The head of the page and the first eight of fourteen rules. **Each rule carries its own denominator on the same line**, in English on the left and Arabic on the right, so neither language can drift into a second document. R6 already reads *not measurable yet*. The whole page is overleaf, at size.

The weekly compliance report, all fourteen rules

One message, both languages, Sunday 07:00 Asia/Riyadh. Every line reads **N of M**; not one of them is a percentage.

Weekly compliance — 14 rules		تقرير الالتزام الأسبوعي — 14 قاعدة
Sunday 07:00 Asia/Riyadh		الأحد 07:00 بتوقيت الرياض
141 organizations × 11 use cases = 1,551 records. 497 live · 179 closed-only · 875 never written down. Every line below carries its denominator. None of them is a percentage.		
كل سطر يحمل مقامه، ولا سطر منها نسبة مئوية.		
R1	A pair carrying more than one open record resolves to: Assignee	26 of 744 pairs زوج يحمل أكثر من سجل مفتوح — 26 من 744
R2	An open record naming no rung resolves to: Assignee	531 of 552 records سجل مفتوح لا يذكر درجته — 531 من 552
R3	Two records with the same title, exactly resolves to: Account Manager	37 titles over 77 tickets عنوانان متطابقان حرفياً — 37 عنواناً في 77 تذكرة
R4	On the ladder with no target date resolves to: the automation account	552 of 552 open records على السلم بلا تاريخ مستهدف — 552 من 552
R5	A rule that resolves to nobody resolves to: PMO Lead	42 of 141 organizations unowned قاعدة لا تُسند إلى أحد — 42 منظمة من 141 بلا مالك
R6	Past the 10-day rung budget resolves to: —	not measurable yet — no rung clock has fired تجاوز مهلة العشرة أيام — غير قابل للقياس بعد
R7	Quiet for 14 days resolves to: Assignee	312 of 497 records that have a clock سجل صامت 14 يوماً — 312 من 497 لها ساعة
R8	Closed with no reason given resolves to: Account Manager	370 of 370 closed onboarding tickets إغلاق بلا سبب مذكور — 370 من 370
R9	More than 10 days with CHI resolves to: PMO Lead, who asks CHI	11 of 26 records at COC أكثر من 10 أيام لدى مركز الضمان الصحي — 11 من 26
R10	Flagged as blocked, waiting party unnamed resolves to: Assignee	2 of 2 flagged tickets مؤشر تعرّف دون تحديد الطرف المنتظر — 2 من 2
R11	A medication record still on the V1 default resolves to: Account Manager	142 of 142 migrated cells الافتراضية — 142 من 142 سجل دواء ما زال على
R12	A record with no interface checklist resolves to: Assignee	550 of 552 open records سجل بلا قائمة تحقق — 550 من 552
R13	A record naming no hospital resolves to: Account Manager	531 of 552 open records سجل لا يسمي مستشفى — 531 من 552
R14	A ticket re-titled into the record convention resolves to: PMO Lead	0 in the period, of 2,049 outside the record تذكرة أعيدت تسميتها لتبدو سجلاً — 0 خلال الفترة، من 2,049 خارج السجل

A rule that resolves to nobody is printed as R5, not dropped. A rule that cannot be computed is printed as not measurable yet, never as zero. An unrecorded fact is not a measurement of nothing.
ولا تُحذف، وما لا يمكن قياسه يُكتب كذلك لا صفراً. R5 القاعدة التي لا تُسند إلى أحد تُطبع باسم
Sent in Arabic and English as one message — never as a second document that drifts.

BRD-002 One record per pair **AGREED**

The onboarding record is one Jira ticket per (organization × use case), opened at initiation and kept open until go-live. The pair lives in two dropdown fields and the title is generated from them — **Onboarding | Organization | Use case** — so the title is decorative, the thirteen conventions retire, and a second ticket is never opened for a pair that already has one.

Measured — **744** distinct pairs are readable from only **922 of 2,971** tickets, across thirteen title conventions of which the largest already covers 391 tickets with 344 still open. **149 of the 744** pairs already carry more than one ticket (327 tickets, 178 to be absorbed) and **37** summary strings are exact duplicates covering **77** tickets.

سجل واحد لكل زوج

سجل ال onboarding هو تذكرة Jira واحدة لكل (منظمة × use case)، تُفتح عند البدء وتبقى مفتوحة حتى ال go-live. الزوج يعيش في قائمتين منسدلتين، والعنوان يُولد منهما — **Onboarding | Organization | Use case** — فيصير العنوان زينة، وتتقاعد الاصطلاحات الثلاثة عشر، ولا تُفتح تذكرة ثانية لزوج له تذكرة أصلاً.

BRD-008 Eleven use cases, and the list is the universe **AGREED**

The use-case option list is eleven — ADT, Medication Prescribe V1, Medication Prescribe V2, Medication Dispense V1, Medication Dispense V2, Rad Report, Rad Order, Lab Result, Lab Order, Clinical Notes, Vital Signs — carried by the existing **Nphies Use Case** single-select with bilingual option labels, scoped to NONP and the Onboarding type. The option list is the target universe; Immunization, Genomics, Consent and NVR stay operational.

Measured — **Nphies Use Case** already exists and is filled on **0 of 2,971** rows. Vital Signs was already live in the data on **36** tickets and 4 distinct pairs; without an option value those tickets could not be filed as onboarding records at all. The product's own catalogue seeds ten rows with **name_ar** empty on all ten.

أحد عشر use case، والقائمة هي الكون كله

قائمة ال use cases أحد عشر — ADT و Medication Prescribe و Medication Dispense V1 و Medication Dispense V2 و Rad Report و Rad Order و Lab و Result و Clinical Notes و Vital Signs — يحملها حقل Nphies Use Case الموجود أصلاً كاختيار مفرد، بخيارات مكتوبة بالعربية والإنجليزية، ومحصورة في NONP وفي نوع ال onboarding. والقائمة هي الكون المستهدف؛ أما Genomics و Immunization و Consent و NVR فتبقى تشغيلية.

BRD-009 141 organizations, and the grid is 1,551**AGREED**

The thirteen identity rulings of 25 August are applied as data, not as a script's guess: Aseer splits into two by hospital system (Care Ware, Vida Plus), Najran into a cluster and a specialized hospital, AlSalama merges to one, all seven of section A merge and all of section B1 merges including Samer Abbas / Samir Abbas. 161 organizations become 141 and the grid becomes $141 \times 11 = 1,551$. The apply writes an undo manifest before its first write.

141 منظمة، والشبكة 1,551

أحكام الهوية الثلاثة عشر الصادرة في 25 أغسطس تُطبق بيانات لا تخمين سكرت: عسير تنقسم اثنتين بحسب نظام المستشفى (Care Ware و Vida Plus)، ونجران تنقسم إلى تجمّع ومستشفى تخصصي، والسلامة تُدمج في واحدة، والقسم أ يُدمج كله، والقسم ب1 يُدمج كله ومنه سامر عباس/سمير عباس. فتصير 161 منظمة 141، وتصير الشبكة $141 \times 11 = 1,551$. والتطبيق يكتب بيان تراجع قبل أول كتابة يكتبها.

Measured — 161 tracker organizations, **24** clusters of near-duplicate map rows and **20** ticket names matching no row. The rulings collapse **20** rows, moving the grid from 1,771 to 1,551, and every row a ruling names was checked against **structure.csv** first — **0 missing**. Aseer alone is 5 rows and 41 tickets; **Aseer** and **Aseer Cluster** name no system and stay flagged pending allocation rather than becoming a 142nd organization.

BRD-010 Jazan stays three rows DEFERRED

The Jazan cluster's three rows stay separate until the owner answers whether MCC and MedicaCloud are one vendor. Nothing merges them meanwhile, and no report implies they are one organization.

جازان تبقى ثلاثة صفوف

صفوف تجمع جازان الثلاثة تبقى منفصلة حتى يجيب المالك: هل MCC وMedicaCloud مورد واحد أم لا. ولا يدمجها شيء في هذه الأثناء، ولا يوحي أي تقرير بأنها منظمة واحدة.

Measured — Jazan is 3 rows and **100** tickets, 16 of them open — the largest ticket count of any unresolved cluster. If it later merges to one the grid moves from **1,551 to 1,529**. **This is a question for the owner — see page 24.**

BRD-013 Medication records default to V1AGREED

Every migrated medication record starts at V1 and is corrected when an OB Account Manager touches it. The version is never inferred from ticket history, and the correction is recorded as a person's act.

سجلات الأدوية تبدأ على V1

كل سجل دواء مُرَجَّل يبدأ على V1 ويُصحَّح حين يمسه OB Account Manager. ولا تُستنتج النسخة من تاريخ التذكرة أبداً، ويُسجَّل التصحيح فعلاً لشخص مسمّى.

Measured — of the **1,047** convention tickets naming a use case, **52** say V2 and **zero** say V1, across roughly **142** covered medication cells — history cannot answer the question, so a default plus a correction is the only honest shape.

BRD-022 The COC chase lives in NphiesCoreAGREED

Jira holds the ticket and its rung; NphiesCore holds the chase — `coc_submitted_on`, `coc_contact`, `coc_reference`, and the chase thread as `entry_updates` rows rather than a fifth column. This is the first write path in the product that anyone uses daily, because the person who needs it is the person asking for it.

متابعة COC تعيش في NphiesCore

Jira يحمل التذكرة ودرجتها، وNphiesCore يحمل المتابعة — `coc_submitted_on` و `coc_contact` و `coc_reference`، وسلسلة المتابعة صفوفًا في `entry_updates` لا عمودًا خامسًا. وهذا أول مسار كتابة في المنتج يستعمله أحد يوميًا، لأن من يحتاجه هو من طلبه.

Measured — `setNodeUseCase` in `src/api/map.ts` has **zero production call sites** — the atom of progress cannot be written from anywhere in the UI — and the product has **eight** ways to look at data against almost no way to change any of it. `entry_updates` is already append-only, authored and timestamped, so a `coc_notes` column would be a second thread whose entries could not be attributed. **Drawn on pages 22 and 23.**

BRD-029 Nothing is cleared until the API is proven AGREED

The 715 imported use-case statuses and the 161 stage records stay in place until the Jira integration is proven. They were given as scaffolding to fine-tune before go-live, and scaffolding comes down after the building stands — and its removal writes an undo manifest first.

لا يُمسح شيء قبل أن يثبت الـ API

الـ 715 حالة use case المستوردة والـ 161 سجل درجة تبقى مكانها حتى يثبت تكامل Jira. أُعطيت سقالة تُضبط قبل الـ go-live، والسقالة تُفك بعد أن يقف المبنى — وفكها يكتب بيان تراجع أولاً.

Measured — **715** use-case statuses and **161** stage records are in the database, every one of the 161 progress rows written by a script with `updated_by = null`; meanwhile the read connection returns **200 with zero rows** for every content query. Clearing them today would leave the product with nothing and prove nothing.

BRD-003 The ladder is the status **AGREED**

The ladder is DEV → STG/TEST → COC → PROD, per use case, and it lives in the workflow status — never in a field and never in the title. Six statuses: Intake, DEV, STG/TEST, COC, PROD, Closed. **Intake** means nobody has said anything about this pair yet; it is not a claim that work has not started, and the seven old statuses retire on this issue type only.

السلم هو الحالة

السلم هو DEV ثم STG/TEST ثم COC ثم PROD، لكل use case على حدة، ويعيش في حالة سير العمل — لا في حقل ولا في العنوان. ست حالات: Intake وDEV وSTG/TEST وCOC وPROD وClosed. وIntake معناها أن أحداً لم يقل شيئاً عن هذا الزوج بعد، وليست ادعاءً بأن العمل لم يبدأ. والحالات السبع القديمة تتقاعد على هذا النوع من العناصر وحده.

Measured — **Stage** is filled on **0 of 2,971** rows; **Application Environment** is filled on 1,274 and **every one** says **Production ; Environments** is filled on all 2,971 with platform tenants. Meanwhile **0** of the 445 Onboarding-family titles name an environment word and **708** tickets elsewhere do — the pair is written on one population and the rung on another.

BRD-004 Blocked is a flag, not a status **AGREED**

Blocked is recorded on three fields that already exist — **Flagged = Impediment**, **Action Pending With** (one of eight parties), **Expected Resolution Date** — plus one comment line saying what was asked and when. The record keeps its rung. **Pending on Vendor** retires as a status, and an expected date in the past is the escalation trigger.

التعثر علامة لا حالة

التعثر يُسجل على ثلاثة حقول موجودة أصلاً — **Flagged = Impediment**، و**Action Pending With** (واحد من ثمانية أطراف)، و**Expected Resolution Date** — مع سطر تعليق واحد يقول ما الذي طُلب ومتى. ويبقى السجل على درجته كما هي. وتتقاعد **Pending on Vendor** كحالة، وتاريخ الحل المتوقع إن مضى فهو نفسه سبب التصعيد.

Measured — all **60 Pending on Vendor** tickets sit in Jira's **To Do** category with real build work behind them, so the status did not merely fail to record the rung, it recorded the wrong one. Their rung is unrecoverable, their median age is **118 days** (oldest 826), **1 of the 60** carries a due date and only **14 of the 60** name a vendor word in the summary. **Flagged** is set on **2 of 2,971** and **Action Pending With** on **0 of 2,971**.

BRD-005 A record closes only from PROD, only with a reason **AGREED**

An Onboarding record may be closed only from PROD, only when all six PROD conditions are met, and only with a Resolution that says why: **Live**, **Merged into duplicate**, **Superseded**, **Not applicable**, **Withdrawn**. PROD stays in the In Progress category because a cutover is not done; **Closed** is the single terminal state and withdrawal is a Resolution, not a status. Nothing is ever closed for inactivity, to clear a queue, or closed-and-reraised.

السجل لا يُغلق إلا من PROD وبسبب مذكور

لا يُغلق سجل الـ onboarding إلا من PROD، وبعد تحقق شروط PROD الستة كلها، وبـ Resolution يقول لماذا: **Live** أو **Merged into duplicate** أو **Superseded** أو **Not applicable** أو **Withdrawn**. ويتبقى PROD ضمن فئة In Progress لأن الـ cutover ليس انتهاءً، و**Closed** هي الحالة النهائية الوحيدة، والانسحاب Resolution لا حالة. ولا يُغلق شيء لركوده، ولا لتفريغ طابور، ولا يُغلق ثم يُعاد رفعه من جديد.

Measured — all **2,165** resolved-and-closed tickets in this instance carry the single Resolution **Done** — including **370 of 370** closed onboarding tickets — so the tracker has never once recorded why anything closed. Re-raising is how **149** pairs came to carry more than one ticket and **37** summary strings became exact duplicates over **77** tickets.

BRD-012 The unowned organizations get a state, not a guess **AGREED**

An organization with no OB Account Manager is marked pending assignment — component lead unset, **pending-owner** on every ticket it carries, **Action Pending With** set to the PMO queue — and the compliance report counts it on its own line so the number is visible on day one and counts down. Its records are created on schedule; an unowned row is the PMO Lead's row until it is given away.

المنظمات بلا مسؤول تأخذ حالة، لا تخميناً

المنظمة التي لا OB Account Manager لها تُوسم بانتظار الإسناد — قائد المكوّن غير محدد، و **pending-owner** على كل تذكرة تحملها، و **Action Pending With** على طابور الـ PMO — ويعدّها تقرير الالتزام في سطر مستقل ليكون الرقم ظاهراً من اليوم الأول ثم ينزل. وتُنشأ سجلاتها في موعدها؛ فالصف بلا مسؤول هو صف قائد الـ PMO حتى يُسلّم لأحد.

Measured — 42 of 161 organizations have no Account Manager and those 42 hold 203 of the never-written pairs — the single largest block of the backlog. 12 of the 36 organizations with zero coverage are also unowned. Blank is what all 42 already are, and blank cannot be told apart from nobody-has-looked.

BRD-014 Ten days per rung, written by automation **AGREED**

The rung budget is 10 days, uniform across DEV, STG/TEST, COC and PROD and configurable as four numbers in one automation rule. **Due date** is written by automation on every rung transition and never typed by a person, and the budget is presented as a measuring stick, not as an observed duration.

عشرة أيام لكل درجة، تكتبها الأتمتة

ميزانية الدرجة عشرة أيام، موحّدة على DEV و STG/TEST و COC و PROD، وقابلة للضبط كأربعة أرقام في قاعدة أتمتة واحدة. و **Due date** تكتبه الأتمتة عند كل انتقال درجة ولا يكتبه إنسان أبداً. والميزانية تُقدّم مسطرة قياس، لا مدة ملحوظة.

Measured — 89 of 2,971 tickets carry a due date, 3 of the 828 open ones and 0 of the 552 open onboarding ones — asking humans for dates has already been tried here. The only end-to-end evidence is 43 pipe-convention tickets that have ever resolved, at a median of 43 days each, against an instance-wide median of 55 days and a slowest tenth above 361.

BRD-024 COC is the one rung only the PMO moves **AGREED**

Any OB Account Manager may advance a record through DEV → STG/TEST → COC; it is faster and it survives leave, and the audit trail records who. Moving off COC is PMO-only, because that is not a delivery act — it records that CHI signed, and it notifies somebody else.

COC هي الدرجة الوحيدة التي لا يحركها إلا الـ PMO

لأي OB Account Manager أن يرفع السجل عبر DEV ثم STG/TEST ثم COC؛ فهذا أسرع، ويصمد أمام الإجازات، والسجل يحفظ من فعله. أما الخروج من COC فلا PMO وحده، لأنه ليس فعل تنفيذ — إنما هو تسجيل أن CHI وقّع، وهو يُبلّغ طرفاً آخر.

Measured — 9 OB Account Managers do this work inside 28 accounts, and four people hold 435 of the 552 open onboarding tickets; a PMO-only gate on one rung of four is the smallest restriction that keeps the signature honest.

BRD-031 Two of every three tickets are not the record **AGREED**

2,049 of the 2,971 tickets are not the onboarding record and are not migrated: they keep their issue type, their queues and their workflow, gain zero required fields, and are attached to a pair with a **Relates** link rather than absorbed. Re-titling a helpdesk ticket into the **Onboarding** | convention, or re-typing an Incident as a record, is itself a finding.

تذكرتان من كل ثلاث ليستا السجل

2,049 من 2,971 تذكرة ليست سجل onboarding ولا تُرَحَّل: تبقى على نوعها وطوابيرها وسير عملها، ولا يُضاف عليها حقل إلزامي واحد، وتُربط بالزوج برابط Relates بدل أن تُبتلع فيه. وإعادة تسمية تذكرة دعم لتوافق اصطلاح Onboarding |، أو تحويل Incident إلى سجل، هي بذاتها ملاحظة تُرفع.

Measured — 2,049 of 2,971 tickets are support, SSO, whitelisting, errors and configuration — 276 of them still open. 1,863 summaries match none of the thirteen conventions at all, and all 180 Problems, all 150 Incidents and all 5 Tests are operational by construction. Any process that treats the project as the record is wrong about 2,049 of 2,971 rows.

BRD-032 Closed-only pairs are attested, then split at 90 days **AGREED**

For every pair whose only tickets are closed, an OB Account Manager attests the rung the work actually reached; only then does a script split at the 90-day line — reopen the 99 closed within 90 days, recreate the 119 older ones and **Relates** - link each to its closed original. An absorbed or superseded ticket is never deleted, never edited and never reopened, so its clocks survive.

الأزواج المغلقة تُفَرَّ أولاً ثم تُقسَم عند التسعين يوماً

كل زوج ليس له إلا تذاكر مغلقة، يقرّ OB Account Manager الدرجة التي بلغها العمل فيه فعلاً؛ وعندها فقط يقسم السكربت عند خط التسعين يوماً: يُعاد فتح الـ 99 التي أُغلقت خلال 90 يوماً، وتُنشأ الـ 119 الأقدم من جديد ويُربط كل منها بأصله المغلق برابط Relates. والتذكرة المبتلعة أو المستبدلة لا تُحذف ولا تُعدّل ولا يُعاد فتحها، فتبقى ساعاتها سليمة.

Measured — 218 of the 744 pairs have no open ticket — 179 of the grid's cells — of which 99 closed within 90 days, 47 within a year and 72 longer ago, at a median resolution date of 21 April 2026. All 370 of 370 closed onboarding tickets carry Resolution **Done**, so no rung can be read from a close, while the map records only 170 of its use-case cells as live.

BRD-030 The announcement stays drafted**DEFERRED**

The bilingual announcement — the email in Arabic and English and the one-paragraph WhatsApp version — stays drafted and unsent, kept because it gave the process a concrete shape. Its three dates are placeholders and none of them is promised until the identity rulings are applied and the Teams channel and open-hour slot are confirmed.

الإعلان يبقى مسودة

الإعلان بلغتيه — البريد بالعربية والإنجليزية، ونسخة الواتساب من فقرة واحدة — يبقى مسودة غير مرسل، ويحتفظ به لأنه أعطى العملية شكلاً ملموساً. وتواريخه الثلاثة مؤقتة، ولا يُوعد بأي منها حتى تُطبّق أحكام الهوية وتُؤكّد قناة Teams وموعد الساعة المفتوحة.

Measured — no dates are committed anywhere in this programme: 89 of 2,971 tickets carry a due date, 3 of the 828 open ones and 0 of the 552 open onboarding ones. The 1 October migration date in the draft depends on a ruling that had not been made when it was written.

BRD-006 Zero new custom fields **AGREED**

The design creates no new custom field. Seven fields that already exist carry the record — **Components**, **Nphies Use Case**, **Account Manager**, **Due date**, **COC Status**, **Baseline end date**, **Action Pending With** — with exactly three required at creation and the rest required only at the transition that needs them. The 498 empty fields are hidden from NONP's screens and contexts rather than bulk-deleted, the nine constant-valued fields are hidden and never repurposed, and no new field is created for NONP without deleting or repurposing one.

لا حقل مخصص جديد

التصميم لا يُنشئ أي حقل مخصص جديد. سبعة حقول موجودة أصلاً تحمل السجل — **Account** و **Nphies Use Case** و **Components** — **Baseline end date** و **COC Status** و **Due date** و **Manager** و **Action Pending With** — ثلاثة منها فقط إلزامية عند الإنشاء، وما بقي إلزامي عند الانتقال الذي يحتاجه وحده. والحقول الـ 498 الفارغة تُخفى عن شاشات NONP وسيافقاته بدل حذفها جملةً، والحقول التسعة ذات القيمة الواحدة تُخفى ولا تُعاد لاستعمال آخر، ولا يُنشأ حقل جديد في NONP إلا بحذف حقل أو إعادة استعماله.

Measured — **533** distinct custom fields exist and **498** are empty on all 2,971 rows — including **Account Manager**, **Delivery status**, **COC Status**, **Checklist Progress %** and **Conformance Status 1** through **17**. A complete governance process was configured here once and every field it depended on is empty. Nine more fields are filled on 178 to 2,971 rows and carry exactly one distinct value each.

BRD-007 Organization lives in Components**AGREED**

The organization is the system **Components** field, one component per organization: the canonical English name as the stable JQL key, the Arabic name in the description, and the OB Account Manager as Component Lead — left blank where there is no owner rather than filled with a placeholder. Exactly one component per record is enforced at the create transition. The six empty fields competing to be the organization field are hidden.

المنظمة تعيش في Components

المنظمة هي حقل Components النظامي، مكوّن واحد لكل منظمة: الاسم الإنجليزي المعتمد مفتاحاً ثابتاً في JQL، والاسم العربي في الوصف، والـ OB Account Manager قائدًا للمكوّن — يُترك فارغاً حيث لا مسؤول، ولا يُملأ باسم مؤقت. ويُكزَم كل سجل بمكوّن واحد لا غير عند انتقال الإنشاء. والحقول الستة الفارغة التي تتنازع على أن تكون حقل المنظمة تُخفى.

Measured — **Related to (migrated)** is filled on **1,940 of 2,971** rows and **26 of its 27** values are organization names, which seed the component list and back-fill **683** tickets on day one (the 1,257 rows saying **Lean Business** name the integrator, not a hospital). **42 of 161** organizations have no owner, and Component Lead turns that statistic into one screen.

BRD-025 The Jira write-back is a new function**GATED**

When the PMO records a certificate as signed, a new **jira-write** edge function writes the signed date and CHI reference to the ticket, posts a comment, and re-assigns to the OB Account Manager only if the ticket is unassigned or held by the PMO — otherwise it comments and leaves the assignee alone. **jira-read** is never widened. Nothing writes until reading works and is trusted.

الكتابة إلى Jira دالة جديدة

حين يسجّل الـ PMO أن الشهادة وقّعت، تكتب دالة **jira-write** جديدة تاريخ التوقيع ومرجع CHI على التذكرة، وتضيف تعليقاً، وتعيد الإسناد إلى الـ OB Account Manager فقط إذا كانت التذكرة بلا مُسند إليه أو بيد الـ PMO — وإلا علّقت وتركت المُسند إليه كما هو. و **jira-read** لا يُوسّع أبداً. ولا يُكتب شيء قبل أن تعمل القراءة ويوثق بها.

Measured — **jira-read**'s frozen four-endpoint allow-list and the test asserting the file contains exactly **two fetch()** calls and **one Authorization:** header are the only formal proof of read-only in this system; widening it would destroy that proof for every existing caller. **The read connection does not work yet** — the scoped token authenticates as an app with no project grants and every content query returns **200 with zero rows**.

BRD-033 Evidence is a link or a tick **AGREED**

Every rung gate takes a link or a checklist tick and never free text: one accepted message of this use case referenced for DEV, the interface checklist reading All Completed enforced at exactly the STG/TEST → COC transition, a signed certificate for this exact pair at COC → PROD — a sibling use case never promotes this one — and a required comment on every backward transition.

الدليل رابط أو علامة صح

كل بوابة درجة تأخذ رابطاً أو علامة في قائمة تحقق، ولا تأخذ نصاً حراً أبداً : رسالة واحدة مقبولة من هذا الـ use case بالذات يُشار إليها لـ DEV، وقائمة تحقق الواجهة وهي تقرأ All Completed مفروضة عند انتقال STG/TEST إلى COC بالتحديد، وشهادة موقعة لهذا الزوج بعينه عند COC إلى PROD — فـ use case شقيق لا يرقّي هذا أبداً — وتعليق إلزامي على كل انتقال إلى الخلف.

Measured — **Resolved confirmation** is filled on **949** rows with **331** distinct values, of which **214** say “done”, **103** say “.” and **103** say “,” — free-text evidence has already decayed into punctuation in this instance. The checklist reached **113 of 2,971** tickets and **105** of those read Not Completed against **9** All Completed, and **550 of 552** open onboarding tickets have none at all.

What no algorithm may do 1 requirement · BRD-011**ما لا يجوز لخوارزم****BRD-011 Nothing is guessed by an algorithm****AGREED**

No algorithm may assert that two organization names are one hospital, that a rung was reached, or that a person owns an organization. Scripts print the evidence beside each candidate and stop; the merge, the rung attestation and the owner assignment are made by a named person. Auto-transitioning a rung from ticket keywords, auto-closing stale records and round-robin assignment are refused for the same reason.

لا شيء يخمنه خوارزم

لا يجوز لخوارزم أن يقرّر أن اسمين لمنظمة هما مستشفى واحد، ولا أن درجة قد بلغت، ولا أن فلاناً يملك منظمة. السكريبتات تعرض الدليل بجانب كل مرشّح ثم تقف؛ أما الدمج، وإقرار الدرجة، وإسناد المسؤول، فيصدر عن شخص مسمّى. والسبب نفسه تُرفض ترقية الدرجة آلياً من كلمات التذكّرة، والإغلاق الآلي للسجلات الراكدة، والتوزيع بالدور.

Measured — the same edit-distance rule at one looser notch collapsed KFSHB into KFSHRC, Rabet into Rabia, Abeer into Aseer, Aya into GAMA and Hail Cluster into Taif Cluster — **five different hospitals, no error message** — giving 149 organizations and 750 pairs against the conservative 161 and 744. The rulings script's own first run invented a **142nd** organization and had to be caught by hand. The programme's six departments and 119 account managers were majority-vote readings of Jira columns rather than statements anyone made.

The cost of one loose notch, stated plainly

An organization list produced by a matcher would have been **shorter** than the honest one, and every number derived from it would have looked **better**. That is the failure mode this requirement exists to prevent: a wrong denominator does not announce itself.

BRD-015 A stage clock counts only if a person started it **BUILT**

A progress row whose `updated_by` is null was written by a service-role script, so its `stage_changed_at` is the moment the script ran: it reads as null days everywhere rather than as zero, and no lateness, budget or quiet verdict is computed from it. Authorship is the test, not a shared timestamp — three rows written in one bulk-bar statement by a person all count.

ساعة الدرجة لا تعدّ إلا إذا بدأها شخص

صف التقدّم الذي `updated_by` فيه فارغ كتبه سكرت بصلاحيّة الخدمة، ف `stage_changed_at` فيه هو لحظة تشغيل السكرت لا أكثر: يُقرأ أياماً فارغة في كل مكان لا أصفاراً، ولا يُحسب منه تأخّر ولا ميزانية ولا حكم بالسكون. والفيصل هو من كتب الصف لا الطابع الزمني — فثلاثة صفوف كتبها شخص واحد في أمر واحد من شريط التحديث الجماعي تُحتسب كلها.

Measured — all 161 `map_node_progress` rows carry `updated_by = null` and exactly two `stage_changed_at` values — 75 rows at 2026-08-22T14:44:16.991611Z and 86 rows at 2026-08-23T17:11:53.997788Z, to the microsecond. Ten days after those instants all 124 not-yet-Live organizations would have crossed their rung threshold within a day of each other and every surface would have reported a programme-wide stall that never happened.

BRD-016 The lateness card names which silence it found **BUILT**

When nothing is measurable the card says which half is missing: `no-clock` when the rungs carry expected durations and nobody has staged an organization, `no-expectation` when no rung has a time yet. It never sends the reader off to do something they have already done, and the two silences cannot merge back into one.

بطاقة التأخّر تسمّي أي صمت وجدت

حين لا يوجد ما يُقاس، تقول البطاقة أي النصفين هو الناقص: `no-clock` حين تحمل الدرجات مدداً متوقعة ولم يسجل أحد درجة لأي منظمة، و `no-expectation` حين لا درجة لها مدة بعد. ولا ترسل القارئ ليفعل شيئاً فعله أصلاً، ولا يمكن للصمتين أن يعودا واحداً.

Measured — the expected durations are set — Kickoff 10, Integrating & Testing 10, UAT 2, Go-live readiness 3 — yet `measurable` fell to 0 across the workspace once import-written clocks stopped counting, and the single arm for that case told the reader to give a stage an expected duration. **Overleaf: both arms, side by side.**

BRD-017 Quiet is fourteen days **AGREED**

A record is quiet when it has had no movement and no comment for 14 calendar days, at any rung. The threshold is configurable and is not to be softened before anyone has seen what it says; quiet starts counting from the first movement a person makes, never from an import stamp.

السكون أربعة عشر يوماً

السجل ساكن إذا مضى عليه أربعة عشر يوماً تقويمياً بلا حركة وبلا تعليق، عند أي درجة. والعتبة قابلة للضبط، ولا تُلين قبل أن يرى الناس ما تقوله؛ والسكون يبدأ عدّه من أول حركة يصنعها شخص، لا من طابع استيراد.

Measured — the median open item is 216 days old, 261 are older than a year and the oldest is 875 days, so a fortnight's threshold lights a large part of the board in week one — the first honest measurement this programme has had rather than a miscalibrated instrument.

The card that reports lateness

serves BRD-016 · rests on BRD-015 · both already built

TODAY

اليوم

No organization's stage was put there by a person, so there is nothing to measure the rungs against.

The rungs do carry expected durations. What is missing is somebody moving an organization onto one — every stage recorded here was written by an import, and an import's timestamp says when the import ran, not how long the work has taken.

Set a stage

The PMO overview already refuses to invent a number — **“No organization’s stage was put there by a person, so there is nothing to measure the rungs against”** — and then sends the reader to set a stage. But this is only one of two possible silences, and the card cannot tell them apart.

AS IT WILL READ

كما ستقرأ

no-clock

Nothing is counting yet

The four rungs carry expected durations — DEV 10, STG/TEST 10, COC 10, PROD 10 days — but nobody has staged a record by hand.

0 of 1,551 records have a clock a person started

Move a record to its rung and its clock starts.

The same silence, now named: **no-clock**. The reader is told the rungs already carry durations, so the missing half is a person’s move — not a setting they have already filled in.

BOTH ARMS, AND WHY THEY CAN NEVER MERGE

الصمتان معاً

The lateness card names which silence it found

Two arms of a closed union. They never merge back into one sentence, and neither sends the reader to do something already done.

البطاقة تسمي الصمت الذي وجدته

no-clock

Nothing is counting yet

The four rungs carry expected durations — DEV 10, STG/TEST 10, COC 10, PROD 10 days — but nobody has staged a record by hand.

0 of 1,551 records have a clock a person started

Move a record to its rung and its clock starts.

no-expectation

No rung carries a time yet

18 of 1,551 records have a person's clock running, but not one rung has an expected duration, so nothing here can be late.

0 of 4 rungs carry an expected duration

Give a rung an expected duration in settings.

Neither card ever prints “0 days late” or “0 at risk”: a measurement nobody took is not a measurement of zero. The union is closed — a third silence breaks the switch at compile time rather than rendering a blank card.

The union is closed and has no **default:** arm, so a third kind of silence breaks the page at compile time rather than rendering a blank card. Neither arm ever prints “0 days late” or “0 at risk”. **One test pins no-clock** on a rung carrying **expected_days**, and a **sibling test pins the genuine no-expectation** case beside it.

BRD-018 The section opens on what is stuck

AGREED

OB monitoring opens on the exception list — what is stuck right now — with coverage, the weekly delta and load below it. Four things raise a flag: flagged as blocked, past the 10-day rung budget, no owner, and gone quiet. A flag that cannot yet be computed is shown as unmeasurable, not as zero.

القسم يفتح على ما هو متعثر

متابعة ال onboarding تفتح على قائمة الاستثناءات — ما هو متعثر الآن — وتحتها التغطية وفرق الأسبوع والحمل. وأربعة أمور ترفع علمًا: موسوم بالمتعثر، وتجاوز ميزانية الدرجة (عشرة أيام)، وبلا مسؤول، وساكن. والعلم الذي لا يمكن حسابه بعد يُعرض بوصفه غير قابل للقياس، لا صفرًا.

Measured — only two of the four can fire on today's data: **42 of 161** organizations have no owner and the median open item is **216 days** old, while **0 of 552** open onboarding tickets carry a due date and **Flagged** is set on **2 of 2,971**. A dashboard whose first screen is a progress bar is one people stop opening. **Drawn on pages 18 and 19.**

BRD-019 The row is a hospital

AGREED

141 rows, one per organization, each carrying its eleven use cases as a strip of rung markers, and the cell is where you drill. All three tiers read the same page and the same numbers, differing only in what it opens on — which means it names individuals, because an Associate Director's queue is a person's queue.

الصف مستشفى

141 صفًا، صف لكل منظمة، يحمل كل صف use cases الأحد عشر شريطًا من علامات الدرجات، والخلية هي موضع التفصيل. والمستويات الثلاثة تقرأ الصفحة نفسها والأرقام نفسها، ولا تختلف إلا فيما تفتح عليه — وهذا يعني أنها تسمي الأشخاص، لأن طابور المدير المساعد طابور شخص.

Measured — the atom is **141 × 11 = 1,551** records, more than anyone reads; one row per use case would answer “how is Lab Order going” and lose the hospital. Four people hold **435 of the 552** open onboarding tickets and **526 of the 828** open items instance-wide — the most actionable fact the PMO holds. The tab it replaces has one row per organization and **no use-case dimension at all.**

BRD-020 The strip reads as position

AGREED

Each use-case track is drawn as position — the marker's distance along DEV → STG/TEST → COC → PROD is the progress — and never as a set of hues. A pair nobody has written down is untouched paper with no marker at all, never a marker at position zero.

الشريط يُقرأ موضعًا

كل مسار use case يُرسم موضعًا — بُعد العلامة على خط DEV ثم STG/TEST ثم COC ثم PROD هو التقدّم — لا مجموعة ألوان. والزوج الذي لم يكتبه أحد ورقة بيضاء بلا علامة أصلًا، لا علامة عند الموضع صفر.

Measured — roughly **1,100 of the 1,551** tracks are empty on day one, so the drawing is mostly a picture of what nobody has said. The same rule is already enforced by `0026_map_node_stages.sql` on the ladder, by `cover.mjs` on the printed report, and by `INK.unrecorded = 'none'` in `build.mjs`. **Drawn on pages 20 and 21.**

What the onboarding section opens on

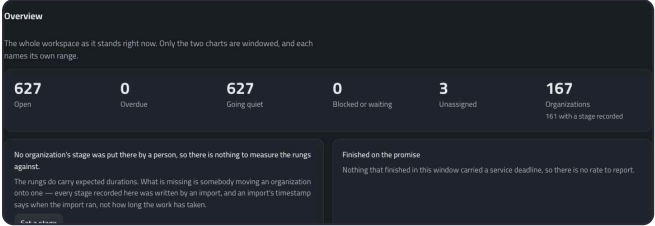

serves BRD-018 · reads BRD-012, 014, 017 · obeys BRD-015

TODAY

اليوم

AS IT WILL READ

كما سيقرأ

Six numbers, and two of them are the problem. **“0 Overdue” and “0 Blocked or waiting” are true arithmetic and false sentences:** no record carries a target date and **Flagged** is set on 2 of 2,971 tickets, so those zeroes measure the absence of an instrument, not the absence of trouble.

What is stuck right now

Flagged as blocked
not measurable yet
Flagged is set on 2 of 2,971 tickets
and Action Pending With on 0 of 2,971

Past the 10-day rung budget
not measurable yet
0 of 552 open records carry a target date;
no rung clock has fired yet

The same two flags, drawn as what they are. A dashed tile reading **not measurable yet** beside the count it would need — and the two that *can* fire today carry real numbers against real denominators.

AND THE LIST ITSELF, WHICH IS THE FIRST THING ON THE PAGE

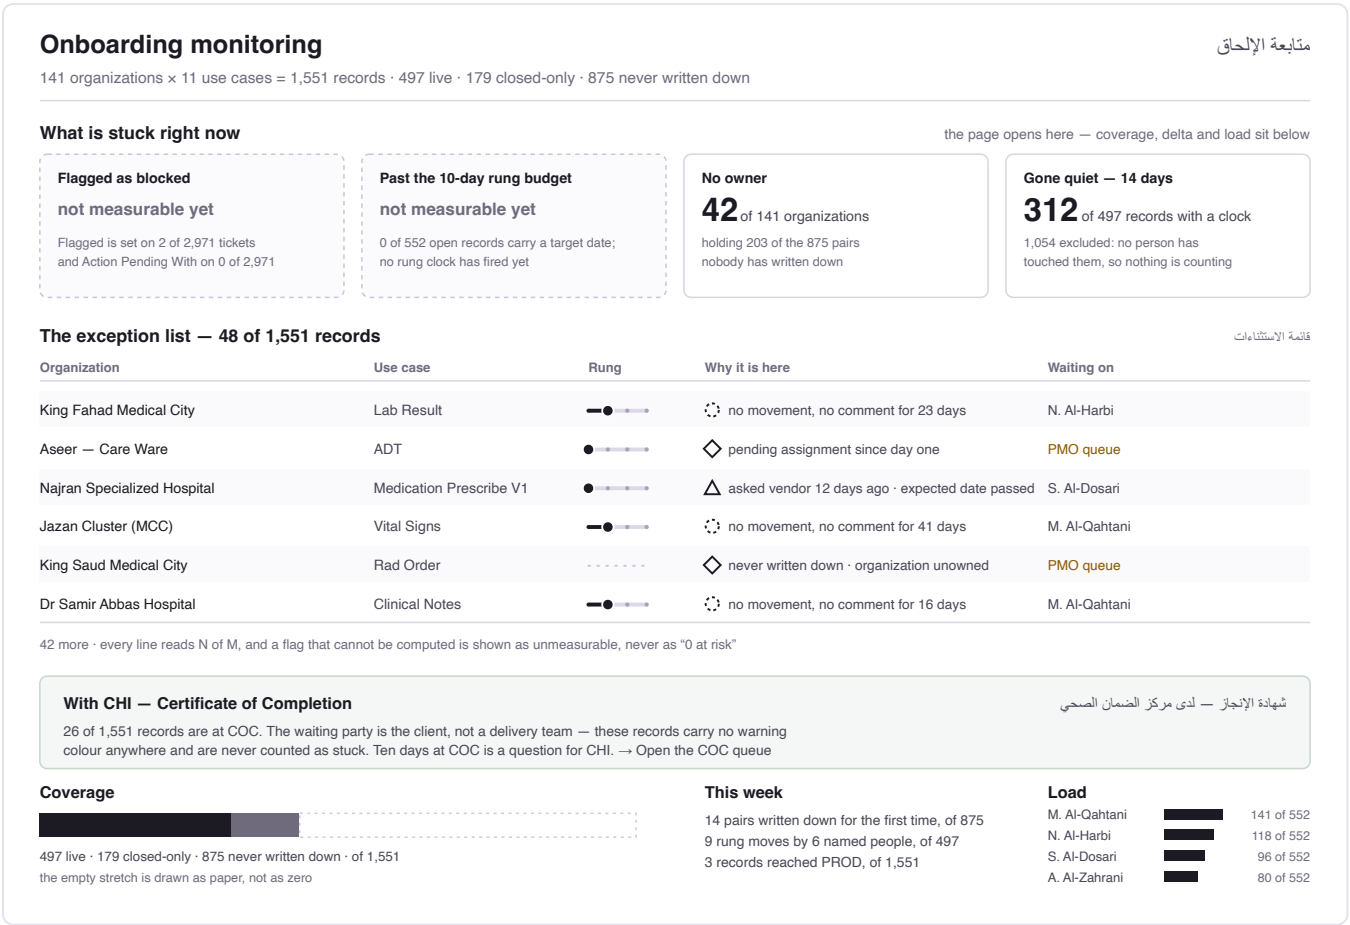

قائمة الاستثناءات

The exception list — 48 of 1,551 records					قائمة الاستثناءات
Organization	Use case	Rung	Why it is here	Waiting on	
King Fahad Medical City	Lab Result	● — — — — —	⚙ no movement, no comment for 23 days	N. Al-Harbi	
Aseer — Care Ware	ADT	● — — — — —	◇ pending assignment since day one	PMO queue	
Najran Specialized Hospital	Medication Prescribe V1	● — — — — —	⚠ asked vendor 12 days ago · expected date passed	S. Al-Dosari	
Jazan Cluster (MCC)	Vital Signs	● — — — — —	⚙ no movement, no comment for 41 days	M. Al-Qahtani	
King Saud Medical City	Rad Order	- - - - -	◇ never written down · organization unowned	PMO queue	
Dr Samir Abbas Hospital	Clinical Notes	● — — — — —	⚙ no movement, no comment for 16 days	M. Al-Qahtani	
42 more · every line reads N of M, and a flag that cannot be computed is shown as unmeasurable, never as “0 at risk”					

One line per stuck record: the hospital, the use case, the rung drawn as position, **why it is here**, and who it is waiting on. A record nobody has written down appears as a dotted track with no marker. The reader is never asked to chase somebody who cannot move the thing — a PMO-queue row says **PMO queue**, not a person’s name.

Onboarding monitoring, the whole first screen

Exceptions first. Coverage, the weekly delta and load sit below them, and COC has a channel of its own because the party being waited on is the client.

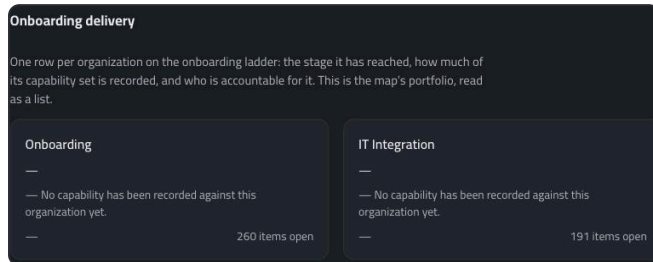

The row, and what is in it

serves BRD-019, BRD-020 · rests on BRD-009, BRD-008

TODAY

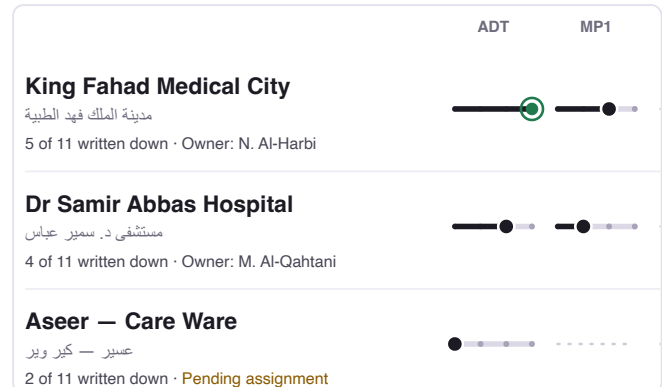

اليوم

This is a real defect, and it is worth looking at closely. The Onboarding delivery tab says “one row per organization” and then lists **Onboarding**, **IT Integration** and **Business Operations** — which are departments, not hospitals. Each one reports “No capability has been recorded against this organization yet” over 260, 191 and 91 open items. There is no use-case dimension anywhere on the page.

AS IT WILL READ

كما سيقرأ

A row is a hospital, with its Arabic name under its English one, its owner — or **Pending assignment** where there is none — and a count of how much of it has been written down. The two columns visible here are ADT and Medication Prescribe V1; there are eleven.

What the defect costs, counted

The tab lists **6 departments** where the design lists **141 hospitals**, and it has **0** use-case columns where the design has **11**. A reader cannot get from that screen to a single one of the 1,551 records, and “no capability recorded” against a department is not a fact about any hospital at all.

In Arabic the whole row mirrors. The label column moves to the right, the eleven use-case columns run right to left, and the rung scale reverses so DEV sits at the right edge. Nothing in the drawing encodes direction except the order of the columns, which is generated from an array.

BRD-021 COC has its own channel **AGREED**

COC is the Certificate of Completion, signed by CHI, the client. Records at COC get their own count, their own list and their own words, and are never folded into “stuck” or coloured as a fault: the waiting party is outside the programme, it is the one rung the PMO itself works, and ten days at COC is a question for CHI rather than for a delivery team.

لـ COC قناتها الخاصة

COC هي شهادة الإنجاز، يوقعها CHI، وهو العميل. السجلات عند COC لها عدّها الخاص وقائمتها الخاصة وكلماتها الخاصة، ولا تُدرج ضمن «المتعثر» ولا تُلوّن على أنها خطأ: الطرف المنتظر خارج البرنامج، وهي الدرجة الوحيدة التي يعمل عليها الـ PMO بنفسه، وعشرة أيام عند COC سؤال لـ CHI لا لفريق تنفيذ.

Measured — 49 of 2,971 tickets say COC or conformance and **COC Status** is filled on 0 of 2,971 — nothing anywhere surfaces this rung today. Every “chase the assignee” sentence applied to a COC record points the reader at somebody who cannot move it.

TODAY

اليوم

The nearest thing the product has to a detail panel: **627 open, 0 overdue, 627 stale** for a whole track. It cannot name a certificate, a CHI contact or a date submitted, because no such field exists anywhere in the product or the tracker.

AS IT WILL READ

كما سيقرأ

Three fields and a rung. **coc_submitted_on** with who recorded it, **coc_contact** — a name and nothing else, no email, no phone, no title — and **coc_reference**, the certificate for this exact pair.

The COC queue, and the chase thread beside it

Jira holds the ticket and its rung. NphiesCore holds the chase — and this is **the first write path in the product that anyone uses daily**.

COC queue — the certificate the PMO chases

26 of 1,551 records are with CHI, the client. Jira holds the ticket and its rung; NphiesCore holds the chase.

Organization	Use case	Submitted on	Days with CHI	CHI contact	Reference
King Fahad Medical City	ADT	14 Jul 2026	43	Faisal Al-Otaibi	CHI-COC-2026-0412
Jazan Cluster (MedicaCloud)	Vital Signs	29 Jun 2026	58	Faisal Al-Otaibi	CHI-COC-2026-0388
Dr Samir Abbas Hospital	Lab Result	02 Aug 2026	24	Faisal Al-Otaibi	CHI-COC-2026-0455
King Saud Medical City	Rad Report	11 Aug 2026	15	Reem Al-Ghamdi	CHI-COC-2026-0471
Najran Cluster	Medication Dispense V1	18 Aug 2026	8	Reem Al-Ghamdi	nobody has said yet
Aseer — Vida Plus	Clinical Notes	nobody has said yet	—	nobody has said yet	nobody has said yet

Days with CHI is counted, never judged: no row here carries a warning colour, because the party being waited on is outside the programme.
An empty cell reads "nobody has said yet", which is not a zero and not a fault.

Add a chase note — it is signed with your name and the time

Record that CHI signed → PROD

PMO only. An OB Account Manager moves DEV → STG/TEST → COC; this rung notifies.

Writes one row in map_node_use_cases and one row in entry_updates, both carrying the author who typed them — never a service-role script, so the stage clock counts.

Days with CHI is counted, never judged. No row carries a warning colour, because the party being waited on is outside the programme. An empty cell reads *nobody has said yet*, which is not a zero and not a fault.

The chase is `entry_updates`, append-only. Not a fifth column and not a notes field — every line carries the person who typed it and the minute they typed it, which a text column could never do.

One button is restricted, and only one. Any OB Account Manager moves a record DEV → STG/TEST → COC. *Record that CHI signed* is PMO-only, because it is not a delivery act: it records a client's signature and it notifies somebody else.

Both writes carry an author. A row in `map_node_use_cases` and a row in `entry_updates`, written by a named person rather than a service-role script — which is exactly what makes the stage clock on page 15 start counting.

BRD-027 Ayenati and Raqeeb are separate tracks AGREED

Ayenati and Raqeeb are separate programmes with their own tracks and their own organizations — not a tag on a hospital and not a grouping of the eleven use cases. A report scopes to a track, which is what “a report for a certain product” means here.

Ayenati و Raqeeb مساران منفصلان

Ayenati و Raqeeb برنامجان مستقلان لهما مساراتهما ومنظمتاهما — لا وسم على مستشفى، ولا تجميعية من الـ use cases الأحد عشر. والتقارير يُحصر في مسار، وهذا هو معنى «تقرير لمنتج معين» هنا.

Measured — `map_nodes.track_id` is derived from the parent by a trigger and is **NOT NULL** at every depth, so two filing axes are unrepresentable and a second track is a first-class thing rather than a workaround. The **nine** archived tracks from the old product were removed for being empty, not because a workspace may hold only one.

BRD-028 One computation, two surfaces AGREED

The exception list on the PMO dashboard and the same data drawn on the map — by department, by vendor, by HIS — read one function. Neither surface restates the other's arithmetic, and a roll-up never shows a number its own children contradict.

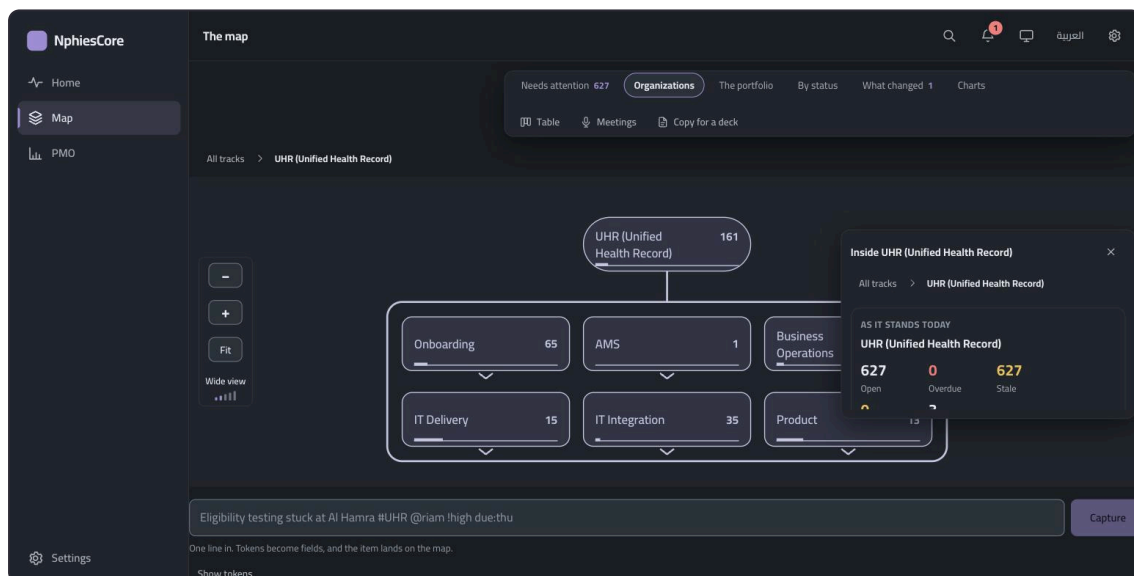

حساب واحد، سطحان

قائمة الاستثناءات في لوحة الـ PMO، والبيانات نفسها مرسومة على الخريطة — بالإدارة وبالمورد وبالـ HIS — تقرأ دالة واحدة. ولا يعيد أي سطح صياغة حساب الآخر، ولا يعرض تجميع رقمًا يكذِّبه أبنائه.

Measured — both surfaces read the same **1,551** records, and `MapBranchDetail.tsx` already carries the rule that a roll-up cannot know the reader's filter and that **a branch labelled 12 showing 3 is the worst thing this map can do**.

TODAY, AND WHAT STAYS

اليوم

The map is not being replaced. UHR sits above six departments and the branch labels already carry counts. What changes is what hangs beneath them — 141 hospitals rather than a department total — and that the counts come from the **same function** the exception list reads, so a branch and the rows inside it can never disagree. The panel on the right is where a cell's eleven tracks will be read. **The target drawing for this surface has not been made yet — see page 27.**

BRD-026 Attachments come in, with three redactions DEFERRED

Attachments are brought in, and “with redaction” means three different things: redact-by-rule for structured text, extract-and-redact for documents, and for images either a human review step before an image becomes visible or images stay a link out to Jira. Nothing lands before the schema gains file storage and `src/pages/Privacy.tsx`, both locale bundles and `ios/App/App/PrivacyInfo.xcprivacy` change in the same commit. Sequenced after the ticket contract, never ahead of it.

المرفقات تدخل، بثلاثة أنواع من الطمس

المرفقات تُجلب، و«مع الطمس» تعني ثلاثة أشياء مختلفة: طمس بقاعدة للنصوص الهيكلية، واستخراج ثم طمس للمستندات، وللصور إما مراجعة شخص قبل أن تظهر أي صورة، وإما أن تبقى الصور رابطاً يخرج إلى Jira. ولا ينزل شيء قبل أن يكسب المخطط تخزيناً للملفات، وقبل أن يتغير `src/pages/Privacy.tsx` وملفا اللغتين `ios/App/App/PrivacyInfo.xcprivacy` في الـ commit نفسه. وترتيبها بعد عقد التذكرة، لا قبله.

Measured — 5,339 attachments: roughly 2,455 images, 1,688 documents and 969 structured-text files. By filename alone 2,307 are named screenshot or capture, 121 name a certificate or a key, 117 an HL7 or message sample, and 23 name a patient, an MRN or an iqama. **A screenshot of a patient list cannot be redacted by a rule**, and the Apple filing currently declares no health data.

This document 3 requirements • BRD-035, 036, 037**هذه الوثيقة****BRD-035 The brief is bilingual, side by side**

AGREED

Every requirement in this brief carries its English and its Arabic side by side, in one file — never as a second document that drifts. The Arabic is written as an original, not fetched as a translation, and every user-visible string in the product it describes goes through `t()` with en/ar parity.

الوثيقة بلغتين، جنباً إلى جنب

كل مطلب في هذه الوثيقة يحمل نصّه الإنجليزي ونصّه العربي جنباً إلى جنب، في ملف واحد — لا في وثيقة ثانية تنحرف عن الأولى. والعربية مكتوبة أصلاً لا مترجمة، وكل نص يراه المستخدم في المنتج الذي تصفه يمرّ عبر `t()` بتكافؤ بين en و ar.

Measured — 0 of the 2,971 ticket summaries contain any Arabic in a programme whose first language is Arabic, and the product's own use-case catalogue seeds ten rows with `name_ar` empty on all ten — a second-language column left blank is exactly how the second document drifts. 37 of 37 requirements in this file carry an Arabic column.

BRD-036 Before and after, per requirement

AGREED

Each requirement that changes a surface shows that surface as it is today beside how it will read, side by side, so the change is visible rather than described.

قبل وبعد، لكل متطلب

كل متطلب يغيّر شاشة يعرض تلك الشاشة كما هي اليوم بجانب كيف ستقرأ، جنباً إلى جنب، ليكون التغيير مرئياً لا موصوفاً.

Measured — three captures of today’s surfaces are on disk — the map, the PMO overview and the PMO delivery tab — and the delivery tab they show carries one row per **organization** with stage, days-in-stage, owner and an open count, with **no use-case dimension at all** against 1,551 records. **In this file: five pairs, on pages 6, 16, 18, 20 and 22, plus the map on page 24.**

BRD-037 The owner alone approves

AGREED

Abdulaziz Alsaloom approves this brief, and nothing in it is built before he does. A job title never carries approval and never grants permission: roles are checked, positions are printed.

المالك وحده يعتمد

عبدالعزیز السلوم هو من يعتمد هذه الوثيقة، ولا يُبنى شيء منها قبل اعتماده. والمسمى الوظيفي لا يحمل اعتماداً ولا يمنح صلاحية: الأدوار تُفحص، والمناصب تُطبع.

Measured — **18** people are on the roster and exactly **2** hold **workspace.admin** ; the programme’s six departments and **119** account managers were majority-vote readings of Jira columns presented as facts nobody had stated, which is what an unapproved fact costs. **Eight** database tables were created three days before nobody used them and no requirement anywhere explains them.

Nine things this brief does not settle

Four are requirements deliberately held back; five are gaps found while writing it. All nine are printed rather than left to be discovered later.

1 • Is Jazan one organization or three? [BRD-010](#)

Jazan is 3 rows and 100 tickets, 16 of them open — the largest ticket count of any unresolved cluster. Nothing merges them meanwhile. If MCC and MedicaCloud turn out to be one vendor, **the grid moves from 1,551 to 1,529** and every denominator in this document moves with it.

NEEDS: ONE ANSWER FROM THE OWNER

2 • The Jira read connection does not work [BRD-025](#)

The scoped token authenticates as an app with no project grants, and every content query returns **200 with zero rows**. Nothing writes to Jira until a read against a named project returns a non-zero row count — and the 715 imported statuses and 161 stage records stay exactly where they are until it does.

BLOCKS [BRD-025](#) • [GATES BRD-029](#)

3 • Two Aseer rows name no hospital system [BRD-009](#)

The rulings split Aseer by hospital system into Care Ware and Vida Plus. [Aseer](#) and [Aseer Cluster](#) name no system, so they stay flagged pending allocation rather than being quietly folded into one of the two or becoming a 142nd organization.

NEEDS: AN ALLOCATION, BY A NAMED PERSON

4 • Forty-two organizations have nobody [BRD-012](#)

They hold 203 of the never-written pairs. Until someone is named, each is **pending assignment** and sits in the PMO Lead's own queue — visible and counting down on its own line, never blank and never filled with a round-robin guess.

NEEDS: 42 NAMES, OVER TIME

5 • The map's target drawing has not been made [BRD-027](#), [028](#)

Five before-and-after pairs are in this file. The map is shown as it is today, on page 24, with the change described in words rather than drawn. That is a gap in BRD-036's own test and it is named here rather than glossed.

OWED: ONE DRAWING

Four gaps found while writing this

None of these is a decision anyone took. They are things the writing turned up, printed here so that they are somebody's to answer rather than nobody's to notice.

6 • Twenty-two migrations belong to no requirement

`0001 – 0022`, dated 29 July to 1 August, are the product this programme was built on. The ledger marks them `pre-brief` and the test pins that set to exactly those twenty-two, so nothing new can ever be filed under the marker. Attributing them to a requirement here would have been the invented fact BRD-011 forbids.

DECIDE: LEAVE AS PRE-BRIEF, OR WRITE 22 ATTRIBUTIONS

7 • Eight tables nobody uses `BRD-037`

`0031_pmo_portfolio.sql` created eight `pmo_*` tables three days before nobody used them. It is recorded in the ledger as the **finding** BRD-037 exists to name, not as a decision anyone made.

NEEDS: KEEP, OR REMOVE WITH A MANIFEST

8 • Attachments, and what redaction cannot do `BRD-026`

Deferred behind the ticket contract. 2,455 images cannot be redacted by any rule — a screenshot of a patient list is a screenshot of a patient list — so either a person reviews each one before it is visible, or images stay a link out to Jira.

SEQUENCED AFTER: BRD-002 ... 008

9 • No date is promised `BRD-030`

The bilingual announcement is written and unsent. Its three dates are placeholders, and the count of dates committed to this programme stays **0** until the owner names them.

NEEDS: THE TEAMS CHANNEL, THE OPEN-HOUR SLOT, THREE DATES

One mark, and what it releases

Thirty of the thirty-seven requirements are **agreed** and waiting on this page. Three are already built and tested. One is gated behind a Jira read that does not work yet, and three are deferred with the reason written down.

What this mark releases

Building the 30 agreed requirements: the ticket contract, the ladder as status, the 141 components, the eleven use-case options, the exception list, the hospital row, the COC queue and its write path, and the weekly bilingual report.

What it does not release

No date is promised. No Jira write happens until a read against a named project returns rows. No imported status or stage record is cleared. No attachment is fetched. Jazan stays three rows.

APPROVED FOR BUILD

Abdulaziz Alsloom — PMO Lead, NphiesCore

عبدالعزیز السلوم — قائد مكتب إدارة المشاريع

Date · التاريخ

A job title never carries approval and never grants permission. This page is the record that a person, not a role, released this work — and no requirement moves from **agreed** to **built** without it.

Requirements in this brief	37, BRD-001 to BRD-037, contiguous
Carrying an Arabic column	37 of 37, in this one file
Before-and-after pairs	5 — pages 6, 16, 18, 20, 22 — plus today's map on page 24, with one drawing still owed
Dates committed anywhere	0, and that is the truth

Approval
