

Applying the three migrations

Everything else is already live, including last night's work: every hospital now carries all eleven use cases, and the detail panel opens with them. These three files are the only thing left, and the only thing I could not do myself — they change the shape of the database, and I have no credential that can do that.

About **twenty minutes**, all of it in one browser tab. Every file ends with a check that stops loudly if anything went wrong, so you will not be left wondering whether it worked.

كل ما سبق منشور بالفعل على الموقع، بما فيه عمل الليلة الماضية: كل منشأة تحمل الآن حالات الاستخدام الإحدى عشرة، ولوحة التفاصيل تبدأ بها. بقيت ثلاثة ملفات فقط، وهي الوحيدة التي لم أستطع تنفيذها بنفسني: لأنها تُغيّر بنية قاعدة البيانات، ولا أملك صلاحية تسمح بذلك. المدة المتوقعة عشرون دقيقة، كلها في نافذة متصفح واحدة. كل ملف ينتهي بفحص يتوقف بوضوح إذا حدث خطأ.

Before you start: nobody should be using the site while these run. You said last night that nobody is, which is why this is a twenty-minute job rather than a planned window

Step 0 — see the new site

0

ACCEPT THE UPDATE PROMPT

1 MIN

Open `nphiescore.com`. If a small bar appears saying “**A new version is available**” with a **Reload** button, press it.

This is why the site looked unchanged to you last night. The app deliberately does not reload underneath you — that would throw away anything you were typing — so it asks first, and until you say yes your browser keeps serving the previous version.

You should then see: the map drawing one box at the top reading **140**, with six departments under it and no panel covering the picture. All six now read in Arabic:

التهنية . التكامل التقني . العمليات التشغيلية . التسليم التقني . المنتج . الدعم والصيانة

Then try these three, which are new since last night. Press **+** four times: the cards should keep growing rather than dying after two presses. Tap a department: its hospitals appear. Tap one of those: the panel should open leading with **eleven use-case rows** — not with the account manager, the way it used to.

افتح الموقع. إذا ظهر شريط صغير يقول «يتوفر إصدار جديد» بجانبه زر «إعادة التحميل» فاضغطه. هذا سبب ظهور الموقع لك بلا تغيير أمس: التطبيق لا يُعيد التحميل من تلقاء نفسه حتى لا يفقد ما تكتبه، بل يسأل أولاً. وحتى توافق، يبقى المتصفح يعرض النسخة السابقة.

Step 1 — open the SQL Editor

1

FIND THE EDITOR

2 MIN

Go to `supabase.com/dashboard` and sign in. Choose the NphiesCore project, then **SQL Editor** in the left sidebar. Press **New query**.

This is the same place the earlier migrations were run from. You are about to paste the contents of three files into it, one at a time, in order.

Order matters. 0032 must finish before 0033, and 0033 before 0034. Each assumes the one before it succeeded.

ادخل إلى لوحة تحكم Supabase، واختر مشروع NphiesCore، ثم «SQL Editor» من القائمة الجانبية، ثم «New query». سنلصق محتوى ثلاثة ملفات واحدًا تلو الآخر بالترتيب. الترتيب مهم: 0032 قبل 0033، و0033 قبل 0034.

Step 2 — run 0032

2

THE USE-CASE LADDER

5 MIN

Open `supabase/migrations/0032_use_case_rungs.sql` in the repository. Select all of it, copy, paste into the editor, and press **Run**.

It adds the ladder each use case climbs — **Intake** → **DEV** → **STG/TEST** → **COC** → **PROD** — the ability to mark a use case **not applicable** to a hospital, the blocked flag with who you are waiting on, the four columns the COC chase needs, and an append-only log of every rung change.

That log is the one that matters most: it is what will finally let the app answer “**what moved this week**”, which nothing in this product has ever been able to say.

Success looks like: “Success. No rows returned.” It gives a rung to all **1,540** use-case rows — 140 hospitals × eleven use cases, the grid that was filled last night. The file ends in four checks: eleven visible use cases, every row given a rung, no row left pointing at a hidden use case, and the change log having recorded something. If any check fails it raises an error naming which one, and **nothing is committed**.

افتح الملف المذكور أعلاه، وانسخ محتواه كاملاً، والصقه في المحرّر، ثم اضغط **Run**. يضيف هذا الملف سلّم المراحل لكل حالة استخدام، وإمكانية تعليم حالة بأنها «لا تنطبق» على منشأة معينة، وعلامة التعليق مع تحديد الجهة المنتظرة، وأعمدة متابعة شهادة الإنجاز، وسجلاً لكل تغيير في المرحلة. النجاح يظهر كرسالة «Success. No rows returned».

Steps 3 and 4 — run 0033, then 0034

3

THE THREE THINGS BEFORE ADT

3 MIN

`supabase/migrations/0033_org_readiness.sql` — same procedure.

Patient Registry and Provider Portal as tick boxes, and SSO as the three states you named: **Not Started, UAT, PRD**. One set per hospital, not one per use case.

نفس الطريقة. يضيف: سجل المرضى وبوابة مقدمي الخدمة كخانتين تحديد، و«الدخول الموحد» بثلاث حالات كما حدّدتها. مجموعة واحدة لكل منشأة، لا لكل حالة استخدام.

4

THE HIS CATALOGUE

3 MIN

`supabase/migrations/0034_his_catalogue.sql` — same again.

Eleven hospital information systems, every name taken from strings your own data already carries.

Rhapsody is deliberately not among them — it is the engine your technical team builds interfaces in, not something a hospital runs, and including it would tag most of the estate with one meaningless value.

Expect: eleven rows in the new `his_products` table, and **every one of your 140 hospitals showing no system recorded**. That is correct, not a failure: this file creates the catalogue and the column and deliberately fills in nobody. Your own data names an HIS for only sixteen hospitals, and each of those sixteen is a **proposal for you to confirm**, not something a migration should assert on your behalf. That list comes to you separately.

يضيف فهرس أنظمة معلومات المستشفيات: أحد عشر نظامًا، كل اسم مأخوذ من بياناتك نفسها. «رابسودي» غير مُدرج عمدًا لأنه محرّك التكامل لدى فريقكم التقني وليس نظامًا تشغله المنشأة.

Step 5 — check, and what to do if it complains

5

CONFIRM IT TOOK

2 MIN

Back in the SQL Editor, run this one line:

```
select name, hidden from use_cases order by sort_order;
```

You should get fifteen rows — eleven with `hidden` false, four true. In `sort_order` they come out in this order, which is **not** the order I have been saying them in: ADT, Medication Prescribe V1, Medication Prescribe V2, Medication Dispense V1, Medication Dispense V2, **Rad Order, Rad Report, Lab Order, Lab Result**, Clinical Notes, then the three hidden XD rows, then **Vital Signs** — visible, and last because it is the one you remembered later — then hidden Encounter History. Order before Report, and Order before Result, is the catalogue's existing numbering and not a fault.

If a file stops with a red error: nothing was committed — the database is exactly as it was before you pressed Run. Copy the error text and send it to me. Do not run the next file, and do not run the same one twice to see if it takes; the checks are there so that a half-finished apply cannot hide.

Every destructive thing that has already happened wrote a record of itself first, in

`docs/EVIDENCE/import-runs/` — the twenty-one merged organizations and the sixty-seven moved use-case rows are each held there in full, so any of it can be walked back row by row.

للتأكد، شغل السطر المذكور أعلاه: يجب أن تظهر إحدى عشرة حالة استخدام ظاهرة وأربع مخفية. وإذا توقفت أي ملف برسالة خطأ حمراء فلم يُحفظ شيء، وقاعدة البيانات كما كانت تمامًا: انسخ نص الخطأ وأرسله لي، ولا تُشغل الملف التالي.

Four things still waiting on you

1 · Aseer — two rows with no system named

`Aseer` and `Aseer Cluster` name no hospital information system, and you asked to split them by what sits underneath. Ticket text leans **Careware 12 mentions to Vida Plus 2**, but that is evidence, not an answer.

2 · Jazan — the same question

You ruled that MCC and MedicaCloud are different systems, so Jazan is two organizations. The bare `Jazan` row still belongs to one of them.

3 · Misbar — two things that do not survive the move

The Grafana pull is a script on your Mac, and the site cannot reach your laptop. And sending email would be the first thing this product has ever sent outside the building — it needs a provider, a sending identity, and a record of what went to whom. See `docs/MISBAR.md`.

4 · The BRD

`docs/guides/brd.pdf`, twenty-nine pages, English and Arabic side by side. You approve it in pieces — the data-model section is the one that unblocks building the screens.

أربعة أمور تنتظر قرارك، ولا تُعطّل الخطوات السابقة لكنها تُعطّل ما بعدها: صفًا «عسير» بلا نظام محدّد، وصف «جازان» المجرّد، وأمر «مسبار» (سحب Grafana وإرسال البريد)، والموافقة على وثيقة المتطلبات.
